User's Manual

# Warnings, Cautions, and Notes as Used in this Publication 

#### Abstract

Warning Warning notices are used in this publication to emphasize that hazardous voltages, currents, temperatures, or other conditions that could cause personal injury exist in this equipment or may be associated with its use.

In situations where inattention could cause either personal injury or damage to equipment, a Warning notice is used.

## Caution

#### Abstract

Caution notices are used where equipment might be damaged if care is not taken.

## Note

Notes merely call attention to information that is especially significant to understanding and operating the equipment.

This document is based on information available at the time of its publication. While efforts have been made to be accurate, the information contained herein does not purport to cover all details or variations in hardware or software, nor to provide for every possible contingency in connection with installation, operation, or maintenance. Features may be described herein which are not present in all hardware and software systems. GE Fanuc Automation assumes no obligation of notice to holders of this document with respect to changes subsequently made.

GE Fanuc Automation makes no representation or warranty, expressed, implied, or statutory with respect to, and assumes no responsibility for the accuracy, completeness, sufficiency, or usefulness of the information contained herein. No warranties of merchantability or fitness for purpose shall apply.

IC200MDL940 Output Module, Relay 2.0 Amp, Isolated Form A 16 Points ..... 8-44
Chapter 9 Discrete Mixed Modules ..... 9-1
IC200MDD840 Mixed Module, 24VDC Positive Logic Input 20 Points / Output Relay 2.0
IC200MDD840 Mixed Module, 24VDC Positive Logic Input 20 Points / Output Relay 2.0 Amp 12 Points ..... 9-2
IC200MDD842 Mixed Module, Output 24VDC Pos. Logic 0.5A Grouped w/ESCP 16 Points/ Input 24VDC Pos/Neg Logic Grouped 16 Points9-6
IC200MDD843 Mixed Module, 24VDC Positive Logic Input Grouped 10 Points / Output Relay 2.0A per Point Grouped 6 Points ..... 9-12
IC200MDD844 Mixed Module, Output 12/24VDC Pos. Logic 0.5A 16 Points / Input 24 VDC Pos/Neg Logic Grouped 16 Points ..... 9-16
IC200MDD845 Mixed Module, Output Relay 2.0A Isolated 8 Points / Input 24VDC Pos/Neg Logic Grouped 16 Points ..... 9-21
IC200MDD846 Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 120VAC Grouped 8 Points ..... 9-27
IC200MDD847 Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 240VAC Grouped 8 Points ..... 9-31
IC200MDD848 Mixed Module, Output 120VAC 0.5 A per Pt Isolated 8 Points / Input 120VAC Grouped 8 Points ..... 9-35
IC200MDD849 Mixed Module Output Relay 2.0A per Pt Isolated 8 Points / Input 120VAC Isolated 8 Points. ..... 9-40
IC200MDD850 Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 240VAC Isolated 4 Points. ..... 9-44
IC200MDD851 Mixed Module, Output 12/24VDC Positive Logic Grouped 16 Points / Input 5/12VDC Pos/Neg Logic Grouped 16 Points ..... 9-48
Chapter 10 Analog Input Modules ..... 10-1
IC200ALG230 Analog Input Module, 12 Bit Voltage/Current 4 Channels ..... 10-2
IC200ALG240 Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8
Channels ..... 10-9
IC200ALG260 Analog Input Module, 12 Bit Voltage/Current 8 Channels ..... 10-17
IC200ALG261 Analog Input Module, 15 Bit Differential Voltage 8 Channels. ..... 10-24
IC200ALG262 Analog Input Module, 15 Bit Differential Current 8 Channels ..... 10-29
IC200ALG263 Analog Input Module, 15 Bit Voltage 15 Channels ..... 10-36
IC200ALG264 Analog Input Module, 15 Bit Current 15 Channels ..... 10-42
Chapter 11 Analog Output Modules ..... 11-1
IC200ALG320 Analog Output Module, 12 Bit Current, 4 Channels. ..... 11-2
GFK-1504K Contents ..... $v$
IC200ALG321 Analog Output Module, 12 Bit Voltage 0 to 10VDC 4 Channels ..... 11-9
IC200ALG322 Analog Output Module, 12 Bit Voltage -10 to +10VDC 4 Channels ..... 11-15
IC200ALG325 Analog Output Module, 13 Bit Voltage 8 Channels ..... 11-21
IC200ALG326 Analog Output Module, 13 Bit Current, 8 Channels ..... 11-28
IC200ALG327 Analog Output Module, 13 Bit Voltage 12 Channels ..... 11-34
IC200ALG328 Analog Output Module, 13 Bit Current, 12 Channels ..... 11-41
IC200ALG331 Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels ..... 11-48
Chapter 12 Analog Mixed I/O Modules ..... 12-1
IC200ALG430 Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2Channels12-2
IC200ALG431 Analog Mixed Module, 12 Bit 0 to 10VDC Input 4 Channels and Output 2 Channels ..... 12-9
IC200ALG432 Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels ..... 12-16
Chapter 13 Mixed Discrete/High-speed Counter Module ..... 13-1
IC200MDD841 Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points ..... 13-2
Chapter 14 Temperature-Sensing Modules ..... 14-1
IC200ALG620 Analog Input, 16 Bit RTD, 4 Channels ..... 14-2
IC200ALG630 Analog Input, 16 Bit Thermocouple, 7 Channels ..... 14-10
Chapter 15 Accessories ..... 15-1
IC200ACC301 I/O Filler Module ..... 15-2
IC200ACC302 Input Simulator ..... 15-3
IC200ACC303 I/O Shorting Bar ..... 15-4
Appendix A Panel Mounting Dimensions ..... A-1
Thermal Considerations ..... A-2
Module Space Requirements ..... A-3
Module Sizes ..... A-4
Panel-Mounting Details ..... A-5
Example Mounting Dimensions ..... A-11
Appendix B Relay Contact Ratings ..... B-1
Appendix C Power Supply Load Requirements ..... C-1
Appendix D I/O Module Keying Summary ..... D-1

## Chapter Introduction

## Getting Started

Read this chapter first to learn about the basics of VersaMax I/O®. To locate detailed information, check the Guide to the VersaMax Document Set below.

## Guide to the VersaMax Document Set

This manual contains descriptions of the many VersaMax I/O and option modules, power supplies, and carriers.

Installation procedures are described in Chapter 2.
The rest of the chapters in this manual describe the wide variety of VersaMax I/O modules, carriers, and accessories that are available.

- Power Supplies: chapter 3
- Carriers: chapter 4
- Interposing Terminals and Terminal Strips: chapter 5
- Expansion Modules: chapter 6
- Discrete Input Modules: chapter 7
- Discrete Output Modules: chapter 8
- Discrete Mixed Modules: chapter 9
- Analog Input Modules: chapter 10
- Analog Output Modules: chapter 11
- Analog Mixed Modules: chapter 12
- Discrete Mixed/High Speed Counter Module: chapter 13
- Temperature-sensing Modules: chapter 14
- Accessories: chapter 15

The appendixes to this manual contain detailed reference information.

## Other VersaMax Manuals

For more information about VersaMax products, consult the manuals described below.

| VersaMax PLC System <br> Manual (catalog number GFK- <br> 1503) | Describes the installation and operation of the PLC System. This <br> manual also contains general information about CPU operation and <br> program features. |
| :--- | :--- |
| VersaMax Ethernet Network <br> Interface Unit User's Manual <br> (catalog number GFK-1860) | Describes the installation and operation of the Ethernet NIU. The <br> Ethernet NIU interfaces an I/O station of VersaMax modules to an <br> Ethernet Network. |
| VersaMax DeviceNet Modules <br> User's Manual (catalog <br> number GFK-1533) | Describes the installation and operation of the DeviceNet NIU and <br> DeviceNet Network Communications Module. <br> The DeviceNet NIU interfaces an I/O station of VersaMax modules to <br> a DeviceNet Network. It operates as a slave on the network. |
| The DeviceNet Network Communications Module can operate as a <br> master or slave on the DeviceNet network. |  |

| Profibus Network. It operates as a slave on the network. |  |

## The VersaMax ${ }^{\circledR}$ Family of Products

The VersaMax family of products provides universally-distributed I/O that spans PLC and PC-based architectures. Designed for industrial and commercial automation, VersaMax I/O provides a common, flexible I/O structure for local and remote control applications. The Versamax PLC provides big-PLC power with a full range of I/O and option modules. VersaMax I/O Stations with Network Interface Modules make it possible to add the flexibility of VersaMax I/O to other types of networks. VersaMax meets UL, CUL, CE, Class1 Zone 2 and Class I Division 2 requirements.

As a scaleable automation solution, VersaMax I/O combines compactness and modularity for greater ease of use. The 70-mm depth and small footprint of VersaMax I/O enables easy, convenient mounting as well as space-saving benefits. Modules can accommodate up to 32 points of I/O each.

The compact, modular VersaMax products feature DIN-rail mounting with up to eight I/O and option modules per "rack" and up to 8 racks per VersaMax PLC or VersaMax I/O Station system. Expansion racks can be located up to 750 meters from the main VersaMax PLC or VersaMax I/O Station rack. Expansion racks can include any VersaMax I/O, option, or communications module.
VersaMax provides automatic addressing that can eliminate traditional configuration and the need for hand-held devices. Multiple field wiring termination options provide support for two, three, and four-wire devices.

For faster equipment repair and shorter Mean-Time-To-Repair, the hot insertion feature enables addition and replacement of I/O modules while a machine or process is running and without affecting field wiring.

## 1

## CPU Modules for VersaMax PLCs

A VersaMax PLC consists of a group of VersaMax modules with a VersaMax CPU and attached power supply in the first position.

All VersaMax CPUs provide powerful PLC functionality. They are designed to serve as the system controller for up to 64 modules with up to 2048 I/O points. Two serial ports provide RS-232 and RS-485 interfaces for SNP slave and RTU slave communications.

VersaMax CPUs are described in the VersaMax PLC User's Manual (GFK-1503). GFK1503 also provides programming information for the VersaMax PLC.

## Basic CPU Features

- Programming in Ladder Diagram, Sequential Function Chart, and Instruction List
- Floating point (real) data functions
- Non-volatile flash memory for program storage
- Battery backup features for program, data, and time of day clock
- Super capacitor provides power to memory for 1 hour
- Over 1 hour, backup battery protects memory contents up to 6 months.
- Backup battery has shelf life of 5 years when not in use.
- Run/Stop switch
- Embedded RS-232 and RS-485 communications

## Available VersaMax CPUs

| CPU with Two Serial Ports, 34kB of Configurable Memory | IC200CPU001 |
| :--- | :--- |
| CPU with Two Serial Ports, 42kB of Configurable Memory | IC200CPU002 |
| CPU with Two Serial Ports, 64kB of Configurable Memory | IC200CPU005 |
| CPU with Two Serial Ports and Embedded Ethernet Interface, <br> 64 kB of Configurable Memory | IC200CPUE05 |

## 1

## Network Interface Units

A VersaMax I/O Station consists of a group of VersaMax modules with a VersaMax Network Interface Unit module and attached power supply in the first position.

The Network Interface Unit provides I/O scanning and a communications interface, allowing a group of VersaMax modules to function as an I/O station on a communications bus. The power supply on the NIU provides power for the modules in the I/O Station. Additional "booster" power supplies can be included in the system if needed for modules with high current requirements.

A Network Interface Unit module has connectors appropriate for its communications network type and status LEDs. NIUs also have rotary dials that can be used to set communications ID information and other parameters. A Genius NIU is shown below.

Available VersaMax NIUs

| Ethernet Network Interface Unit | IC200EBI001 |
| :--- | :--- |
| Profibus Network Interface Unit | IC200PBI001 |
| Genius Network Interface Unit | IC200GBI001 |
| DeviceNet Network Interface Unit | IC200DBI001 |

## Ethernet NIU

The Ethernet Network Interface Unit (IC200EBI001) serves as the connection point between VersaMax I/O modules and a single 10/100Base-T Ethernet network. The NIU supports Modbus/TCP protocol.
For information about the Ethernet Network Interface Unit, refer to the VersaMax System Ethernet Network Communications User's Manual (GFK-1860).

## DeviceNet NIU

The DeviceNet Network Interface Unit (IC200DBI001) is a DeviceNet slave module. DeviceNet supports a variety of communication structures including peer to peer, multimaster and master/slave with broadcasting capabilities. Up to 64 nodes can be connected to a DeviceNet network without bridging or routing.
For information about the DeviceNet Network Interface Unit, refer to the VersaMax System DeviceNet Network Communications User's Manual (GFK-1533).

## Profibus NIU

The Profibus Network Interface Unit (IC200PBI001) operates as a slave on a Profibus-DP Network, automatically exchanging I/O, status, control, and diagnostic data with a master device. The NIU is capable of handling up to 375 bytes of I/O data, consisting of up to 244 bytes of discrete and analog input data and up to 244 bytes of discrete and analog output data. The system host can be any device capable of operating as a bus master.

For information about the Profibus-DP Network Interface Unit, refer to the VersaMax System Profibus Network Modules User's Manual (GFK-1534, revision A or later).

## Genius NIU

The Genius Network Interface Unit (IC200GBI001) operates as a device on a Genius bus. The NIU is capable of handling up to 128 bytes of discrete and analog input data and 128 bytes of discrete and analog output data. The system host can be any PLC or computer capable of controlling the Genius bus.

For information about the Genius Network Interface Unit, refer to the VersaMax System Genius Network Interface Unit User's Manual (GFK-1535).

## Power Supplies

An AC or DC Power Supply module installs directly on the CPU or NIU. The Power Supply provides +5 V and +3.3 V power to the modules in the station. Additional power supplies can be installed on special booster carriers if needed for systems where the number of modules creates the need for a booster. The AC or DC Power Supply on the CPU or NIU and the Power Supply that resides on the Booster Carrier must share the same external power source.

## Available Power Supplies and Carrier

The following VersaMax power supplies and carrier are available:

| 24VDC Power Supply | IC200PWR001 |
| :--- | :--- |
| 24VDC Expanded 3.3V Power Supply | IC200PWR002 |
| 120/240VAC Power Supply | IC200PWR101 |
| 120/240VAC Expanded 3.3V Power Supply | IC200PWR102 |
| 12VDC Power Supply | IC200PWR201 |
| 12VDC Expanded 3.3V Power Supply | IC200PWR202 |
| Power Supply Booster Carrier | IC200PWB001 |

Power supplies are described in chapter 3 of this manual.

## I/O Modules

VersaMax IO and option modules are approximately 110 mm (4.3in) by 66.8 mm (2.63in) in size. Modules can be mounted either horizontally or vertically on several types of available I/O Carriers. Modules are 50 mm ( 1.956 in ) in depth, not including the height of the carrier or the mating connectors.

VersaMax I/O modules are described in this manual. They are grouped into chapters by module type. For more information about a specific module, please refer to the Table of Contents or Index to locate the module description.

## Discrete Module Point LEDs

Individual point LEDs on discrete modules provide status information at a glance. Laser markings on the module identify the LEDs. The positions of the point LEDs always correspond to the module's wiring diagram, whether the module is simple:

LEDs for Discrete Mixed Module IC200MDD845

Wiring Diagram for Module IC200MDD845

or more complex:

Wiring Diagram for Mixed High-speed Counter Module IC200MDD841

## Available I/O Modules

The following types of VersaMax I/O Modules are available:

| Discrete Input Modules |  |
| :---: | :---: |
| Input Module, 120VAC 8 Points | IC200MDL140 |
| Input Module, 240VAC 8 Points | IC200MDL141 |
| Input Module, 120VAC Isolated 8 Points | IC200MDL143 |
| Input Module, 240VAC Isolated 4 Points | IC200MDL144 |
| Input Module, 120VAC 16 Points | IC200MDL240 |
| Input Module, 240VAC16 Points | IC200MDL241 |
| Input Module, 120VAC Isolated 16 Points | IC200MDL243 |
| Input Module, 240VAC Isolated 8 Points | IC200MDL244 |
| Input Module, 125VDC Positive/Negative Logic Isolated 8 Points | IC200MDL631 |
| Input Module, 125VDC Positive/Negative Logic Isolated 16 Points | IC200MDL632 |
| Input Module, 48VDC Positive/Negative Logic Grouped 16 Points | IC200MDL635 |
| Input Module, 48VDC Positive/Negative Logic Grouped 32 Points | IC200MDL636 |
| Input Module, 24VDC Positive/Negative Logic 16 Points | IC200MDL640 |
| Input Module, 5/12VDC Positive/Negative Logic Grouped 16 Points | IC200MDL643 |
| Input Module, 5/12VDC Positive/Negative Logic Grouped 32 Point | IC200MDL644 |
| Input Module, 24VDC Positive/Negative Logic (32 Points | IC200MDL650 |
| Discrete Output Modules |  |
| Output Module, 120VAC 0.5 Amp , Isolated 8 Points | IC200MDL329 |
| Output Module, 120VAC 0.5 Amp, Isolated 16 Points | IC200MDL330 |
| Output Module, 120VAC 2.0 Amp, Isolated 8 Points | IC200MDL331 |
| Output Module, 24VDC Positive Logic 2.0 Amps, w/ESCP 8 Points | IC200MDL730 |
| Output Module, 12/24VDC Positive Logic 0.5 Amp, 16 Points | IC200MDL740 |
| Output Module, 24VDC Positive Logic 0.5 Amp, w/ESCP 16 Points | IC200MDL741 |
| Output Module, 24VDC Positive Logic 0.5 Amp, w/ESCP 32 Points | IC200MDL742 |
| Output Module, $5 / 12 / 24 \mathrm{~V}$ DC Negative Logic 0.5 Amp, 16 Points | IC200MDL743 |
| Output Module, 5/12/24VDC Negative Logic 0.5 Amp, 32 Points | IC200MDL744 |
| Output Module, 12/24VDC Positive Logic 0.5 Amp, 32 Points | IC200MDL750 |
| Output Module, Relay 2.0 Ampt Isolated Form A 8 Points | IC200MDL930 |
| Output Module, Relay 2.0 Amp, Isolated Form A 16 Points | IC200MDL940 |

| Discrete Mixed I/O Modules |  |
| :---: | :---: |
| Mixed Module, 24VDC Positive Logic Input 20 Points / Output Relay 2.0 Amp 12 Points | IC200MDD840 |
| Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points | IC200MDD841 |
| Mixed Module, Output 24VDC Pos. Logic 0.5A Grouped w/ESCP 16 Points / Input 24VDC Pos/Neg Logic Grouped 16 Points | IC200MDD842 |
| Mixed Module, 24VDC Positive Logic Input Grouped 10 Points / Output Relay 2.0A per Point Grouped 6 Points | IC200MDD843 |
| Mixed Module, Output 12/24VDC Pos. Logic 0.5A 16 Points / Input 24 VDC Pos/Neg Logic Grouped 16 Points | IC200MDD844 |
| Mixed Module, Output Relay 2.0A Isolated 8 Points / Input 24VDC Pos/Neg Logic Grouped 16 Points | IC200MDD845 |
| Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 120VAC Grouped 8 Points | IC200MDD846 |
| Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 240VAC Grouped 8 Points | IC200MDD847 |
| Mixed Module, Output 120VAC 0.5A per Pt Isolated 8 Points / Input 120VAC Grouped 8 Points | IC200MDD848 |
| Mixed Module Output Relay 2.0A per Pt Isolated 8 Points / Input 120VAC Isolated 8 Points | IC200MDD849 |
| Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 240VAC Isolated 4 Points | IC200MDD850 |

## Carriers

Carriers provide mounting, backplane communications, and field wiring connections for all types of VersaMax modules. I/O modules can be installed on carriers or removed without disturbing field wiring.

There are three basic I/O Carrier types:

- Terminal-style I/O carriers. Modules mount parallel to the DIN rail.
- Compact Terminal-style I/O Carriers. Modules mount perpendicular to the DIN rail.
- Connector-style I/O Carriers. Modules mount perpendicular to the DIN rail. These carriers are normally used with Interposing I/O Terminals. One type of Interposing I/O Terminals is illustrated below; other types are also available.
See chapter 4 for information about VersaMax I/O Carriers.
Terminal-style I/O carriers have 36 individual terminals for direct connection of field wiring. Auxiliary I/O Terminal Strips are available for applications requiring additional wiring terminals. Chapter 5 of this manual describes the VersaMax Interposing Terminals and Auxiliary I/O Terminal Strips.

## Available I/O Carriers and Terminal Strips

The following types of I/O Carriers, terminals, and cables are available:

| Terminal-Style I/O Carriers |  |
| :---: | :---: |
| Barrier-Style Terminal I/O Carrier | IC200CHS001 |
| Box-Style Terminal I/O Carrier | IC200CHS002 |
| Spring-Style Terminal I/O Carrier | IC200CHS005 |
| Compact Terminal-Style I/O Carriers |  |
| Compact Box-Style I/O Carrier | IC200CHS022 |
| Compact Spring-Style I/O Carrier | IC200CHS025 |
| Connector-Style I/O Carrier |  |
| Connector-Style I/O Carrier | IC200CHS003 |
| Interposing Terminals for use with Connector-Style Carrier |  |
| Barrier-Style Interposing I/O Terminals | IC200CHS011 |
| Box-Style Interposing I/O Terminals | IC200CHS012 |
| Thermocouple-Style Interposing I/O Terminals | IC200CHS014 |
| Spring-Style Interposing I/O Terminals | IC200CHS015 |
| Disconnect-Style Interposing I/O Terminals, Main Base Disconnect-Style Interposing I/O Terminals, Expansion Base | $\begin{aligned} & \text { IC200CHS101 } \\ & \text { IC200CHS102 } \end{aligned}$ |
| Relay-Style Interposing I/O Terminals, Main Base <br> Relay-Style Interposing I/O Terminals, Expansion Base | IC200CHS111 <br> IC200CHS112 |
| Cables for use with Connector-Style I/O Carriers |  |
| 2 connectors, 0.5 m , no shield | IC200CBL105 |
| 2 connectors, 1.0 m , no shield | IC200CBL110 |
| 2 connectors, 2.0 m , no shield | IC200CBL120 |
| 1 connector, 3.0 m , no shield | IC200CBL230 |
| Auxiliary I/O Terminal Strips for use with Terminal-style I/O Carriers and Interposing Terminals |  |
| Barrier-Style Auxiliary I/O Terminal Strip | IC200TBM001 |
| Box-Style Auxiliary I/O Terminal Strip | IC200TBM002 |
| Spring-Style Auxiliary I/O Terminal Strip | IC200TBM005 |
| Other Carriers |  |
| Communications Carrier | IC200CHS006 |
| Power Supply Booster Carrier | IC200PWB001 |

## Expansion Modules

There are two basic types of VersaMax I/O expansion systems, Multi-Rack and Two-Rack Local:

- Multi-Rack: A VersaMax PLC or NIU I/O Station with an Expansion Transmitter Module (IC200ETM001) and one to seven expansion "racks", each with an Expansion Receiver Module (IC200ERM001 or IC200ERM002). If all the Expansion Receivers are the Isolated type (IC200ERM001), the maximum overall cable length is 750 meters. If the expansion bus includes any non-isolated Expansion Receivers (IC200ERM002), the maximum overall cable length is 15 meters.

- Two-Rack Local: A PLC or NIU I/O Station connected directly to one expansion rack with non-isolated Expansion Receiver Module (IC200ERM002). Maximum cable length is 1 meter.

## VersaMax Modules for Expansion Racks

All types of VersaMax I/O and communications modules can be used in expansion racks. Some VersaMax analog modules require specific module revisions as listed below:

| Module | Module Revision |
| :---: | :---: |
| IC200ALG320 | B or later |
| IC200ALG321 | B or later |
| IC200ALG322 | B or later |
| IC200ALG430 | C or later |
| IC200ALG431 | C or later |
| IC200ALG432 | B or later |

## Available Expansion Modules

The following Expansion Modules and related products are available:

| Expansion Modules |  |
| :--- | :--- |
| Expansion Transmitter Module | IC200ETM001 |
| Expansion Receiver Module, Isolated | IC200ERM001 |
| Expansion Receiver Module, Non-isolated | IC200ERM002 |
| Cables | IC200CBL601 |
| Expansion Cable, 1 meter | IC200CBL602 |
| Expansion Cable, 2 meters | IC200CBL615 |
| Expansion Cable, 15 meters | IC200CBL002 |
| Firmware Update Cable | IC200ACC201 |
| Terminator Plug (included with ETM) | IC200ACC302 |
| Connector Kit |  |

See chapter 6 for information about VersaMax Expansion modules.

## Communications Modules

Communications modules provide additional flexibility for VersaMax systems.
These communications modules install on a VersaMax Communications Carrier. Power for the communications module comes from the main system power supply or from a booster supply as shown below.

## Available VersaMax PLC Communications Modules

The following VersaMax PLC communications modules are available:

| Communications Modules |  |
| :--- | :--- |
| Profibus-DP Network Slave Module | IC200BEM002 |
| DeviceNet Network Control Module | IC200BEM103 |
| Asi Network Master Module | IC200BEM104 |
| Communications Carrier | IC200CHS006 |

For information about the Communications Carrier, please see chapter 4.

## Profibus-DP Network Slave Module

The Profibus-DP Network Slave Module (IC200BEM002) is a communications module that exchanges PLC reference table data on the Profibus network. The VersaMax PLC CPU can read and write this data as though it were conventional bit- and word-type I/O data.

Multiple Profibus-DP Network Slave Modules may be used in the same VersaMax PLC. Each one can read up to 244 bytes of data from the network, and send up to 244 bytes of output data. The total amount of combined inputs and outputs is 384 bytes.
For information about the Profibus-DP Network Slave Module, refer to the VersaMax System Profibus Network Modules User's Manual (GFK-1534, revision A or later).

## DeviceNet Network Control Module

The DeviceNet Network Control Module (IC200BEM103) is a communications module that can be configured to operate as a master, as a slave, or as both simultaneously. It can exchange up to 512 bytes of input data and 512 bytes of output data with other devices on the DeviceNet network. The VersaMax PLC CPU can read and write this data as though it were conventional bit- and word-type I/O data.

The Network Control Module operates as a Group 2 Only Client (master) and can communicate only with Group 2 Slave devices. It can also operate as a Group 2 Only or a UCMM-capable Server (slave), or as a master and slave simultaneously.
For information about the DeviceNet Network Control Module, refer to the VersaMax System DeviceNet Network Communications User's Manual (GFK-1533).

## Asi Network Master Module

The VersaMax AS-Interface Network Master (IC200BEM104) conforms to the ASInterface Specification for the master AS-Interface protocol. It can be used to connect a VersaMax PLC or I/O station NIU to an Actuator-Sensor network.

The AS-Interface module supports communications with up to 31 slave devices, exchanging to exchange up to 4 bits of input data and 4 bits of output data per slave address on the Actuator-Sensor network.

For information about the AS-Interface Network Master Module, refer to the VersaMax System ASI Network Communications User's Manual (GFK-1697).

## VersaMax General Product Specifications

VersaMax products should be installed and used in conformance with product-specific guidelines as well as the following specifications:

| Environmental |  |  |
| :---: | :---: | :---: |
| Vibration | IEC68-2-6 | 1G @ ${ }^{\text {a }}$-150Hz, 0.012in p--p @10-57Hz |
| Shock | IEC68-2-27 | 15G, 11ms |
| Operating Temp. |  | 0 deg C to +60 deg C ambient |
|  |  | $-40 \operatorname{deg} \mathrm{C}$ to +60 deg C ambient for I/O carriers, interposing I/O terminals, and auxiliary I/O terminals |
| Storage Temp. |  | $-40 \operatorname{deg} \mathrm{C}$ to +85 deg C |
| Humidity |  | $5 \%$ to $95 \%$, noncondensing |
| Enclosure Protection | IEC529 | Steel cabinet per IP54: protection from dust \& splashing water |
| EMC Emission |  |  |
| Radiated, Conducted | CISPR 11/EN 55011 | Industrial Scientific \& Medical Equipment (Group 1, Class A) |
|  | CISPR 22/EN 55022 | Information Technology Equipment (Class A) |
|  | FCC 47 CFR 15 | referred to as FCC part 15, <br> Radio Devices (Class A) |
| EMC Immunity |  |  |
| Electrostatic Discharge | EN 61000-4-2 | 8KV Air, 4KV Contact |
| RF Susceptibility | EN 61000-4-3 | $10 \mathrm{~V}_{\text {rms }} / \mathrm{m}, 80 \mathrm{Mhz}$ to $1000 \mathrm{Mhz}, 80 \% \mathrm{AM}$ |
|  | ENV 50140/ENV 50204 | $10 \mathrm{~V}_{\text {rms }} / \mathrm{m}, 900 \mathrm{MHz}+/-5 \mathrm{MHZ}$ <br> $100 \% \mathrm{AM}$ with 200 Hz square wave |
| Fast Transient Burst | EN 61000-4-4 | 2 KV : power supplies, 1KV: I/O, communication |
| Surge Withstand | ANSI/IEEE C37.90a | Damped Oscillatory Wave: 2.5 KV : power supplies, I/O [12V-240V] |
|  | IEC255-4 | Damped Oscillatory Wave: Class II, power supplies, I/O [12V-240V] |
|  | EN 61000-4-5 | $2 \mathrm{kV} \mathrm{cm}(\mathrm{P} / \mathrm{S}) ; 1 \mathrm{kV} \mathrm{cm}$ (I/O and communication modules) |
| Conducted RF | EN 61000-4-6 | $10 \mathrm{~V}_{\text {rms }}, 0.15$ to $80 \mathrm{Mhz}, 80 \% \mathrm{AM}$ |
| Isolation |  |  |
| Dielectric Withstand | UL508, UL840, IEC664 | 1.5KV for modules rated from 51V to 250V |
| Power Supply |  |  |
| Input Dips, Variations | EN 61000-4-11 | During Operation: Dips to $30 \%$ and $100 \%$, <br> Variation for AC +/-10\%, <br> Variation for DC $+/-20 \%$ |

## Chapter <br> Installation Instructions

 2This section gives basic installation instructions.

- Preinstallation Check
- Conformance to Standards
- Thermal Clearance
- DIN Rail and Panel Mounting
- Installing Carriers
- Expansion System Installation
- Installing a Power Supply
- System Wiring Guidelines
- System Grounding
- Installing Wiring for I/O Devices
- Installing Modules

## Preinstallation Check

Carefully inspect all shipping containers for damage during shipping. If any part of the system is damaged, notify the delivery service immediately. The damaged shipping container should be saved as evidence for inspection by the delivery service. As the consignee, it is your responsibility to register a claim with the delivery service for damage incurred during shipment. However, GE Fanuc will fully cooperate with you, should such action be necessary. After unpacking the VersaMax modules and other equipment, record all serial numbers. Serial numbers are required if you should need to contact Product Service during the warranty period of the equipment. All shipping containers and all packing material should be saved should it be necessary to transport or ship any part of the system.

## Conformance to Standards

Before installing VersaMax products in situations where compliance to standards or directives from the Federal Communications Commission, the Canadian Department of Communications, or the European Union is required please refer to GE Fanuc's Installation Requirements for Conformance to Standards, GFK-1179.

## Thermal Considerations

The thermal performance specified for modules in this manual requires a clearance of 2 inches $(5.1 \mathrm{~cm})$ above and below the modules and 1 inch $(2.54 \mathrm{~cm})$ on each side of the modules as shown below, regardless of the orientation of the DIN rail.
When using a vertical DIN rail, the CPU or NIU module must be installed at the bottom.
Individual modules have may additional clearance requirements as shown in appendix A.

## DIN Rail and Panel Mounting

Each rack in a VersaMax PLC or VersaMax I/O Station must be installed on a single section of 7.5 mm X 35 mm DIN rail, 1 mm thick. Steel DIN rail is recommended. "Rack" is the term used for a CPU, NIU, or Expansion Receiver, plus up to 8 physically-connected I/O carriers. The first rack in a system is called Rack 0. If there are multiple expansion racks, Rack 0 also includes an Expansion Transmitter module installed in the leftmost position, before the CPU or NIU.

The DIN rail used in a VersaMax installation must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish. DIN rails compliant with DIN EN50022 are preferred.

For vibration resistance, the DIN rail should be installed on a panel using screws spaced approximately 5.24 cm ( 6 inches) apart. DIN-rail clamps (available as part number IC200ACC313) can also be installed at both ends of the station to lock the modules in position.
For applications requiring maximum resistance to mechanical vibration and shock, the DIN-rail-mounted carriers should also be mounted on the panel. Panel mount holes can be located on the panel by using the carrier as a template, or by following the dimensions shown in appendix A. Pre-drill the mounting holes and install the CPU, NIU, ERM, and carriers using M3.5 (\#6) screws.

## DIN Rail Installation Steps

VersaMax CPUs, Network Interface Unit (NIU) modules, Expansion Receiver (ERM) modules, and module carriers snap easily onto the DIN rail. No tools are required for mounting or grounding to the DIN rail.

Before joining module carriers to a CPU, NIU, or ERM, remove the connector cover on the righthand side of the CPU, NIU, or ERM. Do not discard this cover; you will need to install it on the last carrier.

Slide carriers along the DIN rail to engage the connectors in the sides of adjacent carriers. To avoid damaging connector pins, do not force or slam carriers together.

Install the connector cover that was removed over the connector on the last carrier to protect the connector pins and to provide compliance with standards.

## Installing an Expansion Transmitter Module

An Expansion Transmitter Module must be installed to the left of a CPU or NIU.

1. Make sure rack power is off.
2. Attach the Expansion Transmitter to DIN rail to the left of the CPU or NIU.
3. Slide the module toward the CPU or NIU and press together until the connectors are mated.
4. After completing any additional system installation steps, apply power and observe the module LEDs.

## Removing an Expansion Transmitter Module

1. Make sure rack power is off.
2. Slide module on DIN rail away from the CPU or NIU in the main rack.
3. Using a small screwdriver, pull down on the tab on the bottom of the module and lift the module off the DIN rail.

## Installing an Expansion Receiver Module

An Expansion Receiver Module (IC200ERM001 or 002) must be installed in the leftmost slot of each VersaMax expansion "rack".

1. Insert the label inside the small access door at the upper left corner of the module.
2. Attach the module to the DIN rail at the left end of the expansion rack.
3. Select the expansion rack ID (1 to 7) using the rotary switch under the access door at upper left corner of the module. Each rack must be set to a different rack ID. With a single-ended cable (one expansion rack only), set the Rack ID to 1.

4. Install a VersaMax Power Supply module on top of the Expansion Receiver. See "Installing a Power Supply" in this chapter for details.
5. Attach the cables. If the system includes an Expansion Transmitter Module, attach the terminator plug to the EXP2 port on the last Expansion Receiver Module.
6. After completing any additional system installation steps, apply power and observe the module LEDs.

## Removing an Expansion Receiver Module

1. Make sure rack power is off.
2. Un-install the Power Supply module from the Expansion Receiver Module.
3. Slide the Expansion Receiver Module on DIN rail away from the other modules.
4. Using a small screwdriver, pull down on the tab on the bottom of the module and lift the module off the DIN rail.

## Connecting the Expansion Cable: RS-485 Differential

For a multiple-rack expansion system, connect the cable from the expansion port on the Expansion Transmitter to the Expansion Receivers as shown below. If all the Expansion Receivers are the Isolated type (IC200ERM001), the maximum overall cable length is 750 meters. If the expansion bus includes any non-isolated Expansion Receivers (IC200ERM002), the maximum overall cable length is 15 meters.

Install the Terminator Plug (supplied with the Expansion Transmitter module) into the lower port on the last Expansion Receiver. Spare Terminator Plugs can be purchased separately as part number IC200ACC201 (Qty 2).

RS-485 Differential Inter-Rack Connection (IC200CBL601, 602, 615)

## Building a Custom Expansion Cable

Custom expansion cables can be built using Connector Kit IC200ACC202, Crimper AMP 90800-1, and Belden 8138, Manhattan/CDT M2483, Alpha 3498C, or equivalent AWG \#28 ( $0.089 \mathrm{~mm}^{2}$ ) cable.

## Connecting the Expansion Cable: Single-ended

For a two-rack local system with one non-isolated expansion rack (IC200ERM002) and NO Expansion Transmitter, connect the expansion cable from the serial port on the VersaMax CPU or NIU to the Expansion Receiver as shown below. The maximum cable length is one meter. Cables cannot be fabricated for this type of installation; cable IC200CBL600 must be ordered separately.

VersaMax PLC or NIU I/O Station Main Rack

No Terminator Plug is needed in a single-ended installation; however, it will not impede system operation if installed.

## Single-Ended Inter-Rack Connection Cable (IC200CBL600)

## Installing a Power Supply

I/O and option modules receive power for their operation from the CPU, NIU, or Expansion Receiver Module via the mating connector on the carrier. The number of modules that can be supported depends on the power requirements of the modules (which are listed in the individual module specifications).

Power Supply Booster Carriers can be used as needed to meet the power needs of all modules. The AC or DC Power Supply on the CPU or NIU and the Power Supply that resides on the Booster Carrier must share the same external power source.
In some cases, the field devices served by an I/O module require additional AC or DC power, which must be provided using an "external" power supply. Specifications and connection details for such external power supplies are given in the module specifications in this manual.

## Installing a Power Supply Module

The power supply module installs directly on top of a CPU, NIU, ERM, or booster carrier. The latch on the power supply must be in the unlocked position.

Align the connectors, tab, and latch post on the power supply to be parallel with the CPU, NIU, ERM, or carrier. Press the power supply module down firmly, until the two tabs on the bottom of the power supply click into place. Be sure the tabs are fully inserted in the holes in bottom edge of the CPU, NIU, ERM, or booster carrier.

Turn the latch to the locked position to secure the power supply in place.

Note: The VersaMax power supply is not hot-swappable. Hot inserting or extracting the power supply is an improper method to power-down or power-up. Hot inserting the power supply can cause a "Corrupted User Memory Fault" condition. Power-cycling should only be accomplished by switching the main power going into the power-supply.

## Removing a Power Supply

1. Switch off the external power source to the power supply module.
2. Turn the latch to the unlocked position.

3. Press in the tabs on the lower edge of the power supply
4. Pull the power supply straight off.

## System Wiring Guidelines

Four types of wiring may be encountered in a typical factory installation:

- Power wiring - the plant power distribution, and high power loads such as high horsepower motors. These circuits may be rated from tens to thousands of KVA at 220 VAC or higher.
- Control wiring - usually either low voltage DC or 120 VAC of limited energy rating. Examples are wiring to start/stop switches, contactor coils, and machine limit switches. This is generally the interface level of discrete I/O.
- Analog wiring - transducer outputs and analog control voltages. This is the interface level to I/O analog blocks.
- Communications and signal wiring - the communications network that ties everything together, including computer LANs, MAP, and field busses.
These four types of wiring should be separated as much as possible to reduce the hazards from insulation failure, miswiring, and interaction (noise) between signals. A typical control system may require some mixing of the latter three types of wiring, particularly in cramped areas inside motor control centers and on control panels.
In general, it is acceptable to mix the communications bus cable with the I/O wiring from the blocks, as well as associated control level wiring. All noise pickup is cumulative, depending on both the spacing between wires, and the distance span they run together. I/O wires and communications bus cable can be placed randomly in a wiring trough for lengths of up to 50 feet. If wiring is cord-tied (harnessed), do not include the bus cable in the harness, since binding wires tightly together increases the coupling and mechanical stress that can damage the relatively soft insulation of some serial cable types. Consider using shielded cable in electrically noisy environments.
Wiring which is external to equipment, and in cable trays, should be separated following National Electrical Code practices.

## Installing Power and Ground Wiring

Power Supply terminals accommodate one AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). Use copper wire rated for 90 degrees $C$. When inserting two wires in the same position, the wires must be the same size and the same type (solid or stranded).

Connect the ground terminal to the conductive mounting panel with a 4-inch maximum length of AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ ) wire. Use hardware such as star washers to ensure ground integrity.

## Grounding DC Power Supplies

DC power supplies are non-isolated. DC- must be grounded to frame / earth ground. DCis grounded to frame internally in the Power Supply. As a result, floating power supplies cannot be used.

## Grounding AC Power Supplies

AC power supplies are isolated. Therefore, the AC source does not have to be grounded. However, it is recommended to only use ground-referenced sources such as a neutral line or grounded center-tap transformer.

## Jumper Installation on an AC Power Supply Module

AC power supply modules (IC200PRW101 and IC200PWR102) can be used with either 120 VAC or 240 VAC nominal input power. For 120VAC nominal operation, install a jumper as marked on the power supply. Use insulated AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire.

The power supply operates without a jumper installed; however, the hold-up specification is not met. If a jumper is not installed for 120 VAC operation, the power supply will not cause hazardous conditions.

## Warnings

DO NOT USE A JUMPER FOR 240VAC OPERATION. If a jumper is used on the input connector for 240VAC nominal operation, the power supply will be damaged and may cause hazardous conditions.
Do not touch the exposed portions of the jumper wire with power applied to the system. Hazardous voltages are present that could cause personal injury.

## Installing Additional Suppression

For agency compliance, external MOV suppression is required from both the positive and negative input to frame ground or at the power line input of a system enclosure (see below). The axial-leaded ZA series of MOVs from Harris is often used. The 20 mm size, model V36ZA80 rated at 160 joules is sufficient for both supply types. The MOV should be able to handle most line transients. Measurement of actual transients may be required in extreme cases to decide what MOV is best.

## Installing Suppression at the Power Supply

Typical power and ground connections are shown below.

## Installing Suppression for Devices in an Enclosure

For a group of devices installed in an enclosure, MOVs can be installed at the point where the power lines enter the enclosure. Ideally, MOVs should be used at each cabinet in the system for maximum protection. The following illustration shows suppression on both power lines and a communications bus entering an enclosure.

## Periodic Inspection and Replacement of MOVs

MOVs do a good job of absorbing transients on communications, control, and power lines, provided the total energy of those transients does not exceed the rating of the device.
However, if the energy of the transient exceeds the rating of the device, the MOV may be either damaged or destroyed. This failure may not be visibly or electrically evident. MOVs should be regularly inspected for signs of damage to assure continued protection against transients. For some applications, periodic replacement of critical MOVs is recommended, even if they do not show signs of damage.

## System Grounding

All components of a control system and the devices it controls must be properly grounded. Ground conductors should be connected in a star fashion, with all branches routed to a central earth ground point as shown below. This ensures that no ground conductor carries current from any other branch.

The control panel and enclosure should also be bonded to the plant system ground per code. Inadequate grounding may compromise system integrity in the presence of power switching transients and surges.

## Installing Wiring for I/O Devices

## Wiring to Inductive Loads

When wiring outputs to inductive loads, use of external suppression circuits is recommended. If possible, the external suppression circuits should be connected across the actual load. If that is not possible, external suppression circuits should be connected to each point that will drive an inductive load as shown below.

## Wiring for a Compact I/O Carrier (IC200CHS022, IC200CHS025)

Each terminal on a Compact-style I/O Carrier accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). Use copper wire rated for 90 degrees C. When inserting two wires in the same position, the wires must be the same size and type (solid or stranded).
The I/O carrier can accommodate current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.
For a Box-Style I/O Carrier, recommended terminal torque is .37 to $.45 \mathrm{ft}-\mathrm{lbs}$.
The label provided with the module can be folded and inserted in the label holder.

## Terminal Numbering for a Box- or Spring-Style Compact I/O Carrier

$$
\begin{aligned}
& \text { (A13) A14) A15 (A16) A17) A188 (B13) (B14) (B15) B16) (317 (B18) } \\
& \text { (A7) AB A9 A10 (A11) A12 (B7) B8 (B9) (B11 (B12) } \\
& \text { (A1) A2 AB A4 A5 A6 B1 B2 B3 B4 B5 B6 }
\end{aligned}
$$

## Wiring for a Box-Style I/O Carrier or Spring-Style I/O Carrier (IC200CHS002, IC200CHS005)

Each terminal on a Box-Style or Spring-Style I/O Carrier accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). Use copper wire rated for 90 degrees C . When inserting two wires in the same position, the wires must be the same size and type (solid or stranded).
The I/O carrier can accommodate current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.
For a Box-Style I/O Carrier, recommended terminal torque is .37 to $.45 \mathrm{ft}-\mathrm{lbs}$.
The label provided with the module can be folded and inserted in the module's transparent door.

## Terminal Numbering for a Box-Style or Spring-Style I/O Carrier

$$
\begin{aligned}
& \text { (A1) A2 A3 A4 A5 A6 A7 A8 A9 A10 A11) A12 A13 A14) A15 A16 A17) A18 } \\
& \text { (B1) (B2) (B3) B4) (B5) (B6) B7 (B8) B9) (B10) (B11) (B12) (B13) (B14) (B15) (B16) (B17) (B18) }
\end{aligned}
$$

## Wiring for a Barrier-Style I/O Carrier (IC200CHS001)

Each terminal on a Barrier-Style I/O Carrier accommodates one or two solid or stranded wires from AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) to AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section). Use copper wire rated for 90 degrees $C$. When inserting two wires in the same position, the wires must be the same size and type (solid or stranded).

The I/O carrier can accommodate current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

For a Barrier-Style I/O Carrier, recommended terminal torque is .37 to $.50 \mathrm{ft}-\mathrm{lbs}$.
The label provided with the module can be folded and inserted in the module's transparent door.

## Terminal Numbering for a Barrier-Style I/O Carrier

## Wiring for a Connector-Style I/O Carrier (IC200CHS003)

For a Connector-Style I/O Carrier field connections are usually made to an Interposing I/O Terminal unit and one or more Auxiliary I/O Terminals. However, it is also possible to make field wiring connections directly to the Connector-Style I/O Carrier itself using contacts crimped to the ends of the field wires.

## Prewired Cables for a Connector-Style I/O Carrier

Connection between a Connector-Style I/O Carrier and Interposing I/O Terminals is made by cable. The following cables are available:

| IC200CBL105 | 2 connectors, 0.5 m , no shield |
| :--- | :--- |
| IC200CBL110 | 2 connectors, 1.0 m , no shield |
| IC200CBL120 | 2 connectors, 2.0 m , no shield |
| IC200CBL230 | 1 connector, 3.0 m , no shield |

## Installing and Removing a Prewired Cable

To install a prewired connecting cable, place the cable connector over the connector on the carrier and press downward until the latch engages the tab on the connector. (If you have an IC200CBLxxx cable with a non-molded style connector, please turn to appendix E for installation and removal instructions).

To remove the cable, hold the cable connector and press up on the latch to release the connector. When removing the cable, remember that operating equipment may be very hot, especially at higher ambient temperatures. If the equipment is hot, do not touch it directly.

DO NOT TOUCH exposed connector pins if the system is operating.

## Connector Kit

A connector kit (part number IC200ACC304) is available for building custom cables or for connecting wires directly from field devices. The kit includes a connector and cover, two screws, 36 small contacts, and 6 large contacts. The following equipment is also required but not included in the kit:

| Crimping Tools | small contact | Molex 11-01-0008 |
| :--- | :--- | :--- |
|  | large contact | Molex 11-01-0084 |
| Extraction Tools | small contact | Molex 11-03-0002 |
|  | large contact | Molex 11-03-0006 |

## Terminal Numbering

The illustration below shows the terminal assignments of the connector pins as viewed from above.

## Terminal Assignments for Cable IC200CBL230

The tables that follow show terminal assignments for cable IC200CBL230. Cable IC200CBL230 is available in two cable types. They are functionally equivalent. The cable type is marked on the cable.

## Caution

Do not insert a test probe into the contacts. Permanent damage to the contacts will result.

## Installing Interposing I/O Terminals IC200TBM011, IC200TBM012, IC200TBM014, IC200TBM015

Interposing I/O Terminals are used to provide field-wiring connections to a Connectorstyle I/O Carrier (IC200CHS003). Installation and wiring for several styles of Interposing I/O Terminals is described in this section.
The Interposing I/O Terminals illustrated below are available with box-style terminals (IC200TBM002), spring-clamp style terminals (IC200TBM005), or barrier-style terminals (IC200TBM001). A version with box-style terminals and a built-in thermistor (IC200TBM014) is also available for use with Thermocouple modules, as described in chapter 14. A clear protective hinged door covers the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.

These Interposing I/O Terminals unit can be mounted on the same DIN rail as the Connector-Style I/O Carrier, or on a separate DIN rail. For applications requiring maximum resistance to mechanical vibration and shock, the Interposing I/O Terminals must also be panel-mounted.
Use copper wire rated for 90 degrees $C$. When inserting two wires in the same position, the wires must be the same size and type (solid or stranded). Wire specifications depend on the terminal type.

## Wiring Specifications for IC200TBM012, IC200TBM014, and IC200TBM015

For box-type or spring type terminals, each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

## Wiring Specifications for IC200TBM011

For barrier-type terminals, each terminal accommodates one or two solid or stranded wires from AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) to AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section).

## Installing Disconnect-Style Interposing I/O Terminals IC200CHS101, IC200CHS102

The Disconnect-Style Interposing I/O Terminals (IC200CHS101 and IC200CHS102) interface a VersaMax Connector-Style I/O Carrier to field wiring and provide an integrated disconnect option for field devices connected to VersaMax I/O modules. The Main Base, IC200CHS101, provides terminals that correspond to the "A" terminals on a VersaMax I/O module. If the I/O module also has "B" terminals, an Expansion Base, IC200CHS102) is also needed.

Field wiring to the interposing disconnect bases follows the standard wiring diagram for each module. Terminals A1-A18 and B1-B18 on the interposing disconnect terminal bases are connected in the same fashion as all other bases. The built-in auxiliary terminals (W1-W8, X1-X8, Y1-Y8, Z1-Z8) are positioned directly below the A or B terminals to provide for simple two-wire connection of field devices.

Each group of auxiliary terminals has a dedicated terminal to jumper the group to the appropriate VersaMax terminal (The "W" terminal is the connection point for W1-W8, etc.). The installation of these jumpers depends on the grouping present on the I/O module, as shown on the following pages.

## Disconnect-Style Interposing I/O Bases, Terminal Wiring

Each terminal accommodates:

- one solid ( 0.2 to $4.0 \mathrm{~mm}^{2}$ cross section) or stranded ( 0.2 to $2.5 \mathrm{~mm}^{2}$ cross section), AWG \#12 to AWG \#24.
When inserting two wires in the same position, the wires must be the same size and type (solid or stranded):
- Rigid or flexible wires: 0.2 to 1.5 mm 2 cross section.
- Stranded wires with ferrules, no plastic sleeve: 0.25 to $0.75 \mathrm{~mm}^{2}$ cross section
- Stranded wires with twin ferrule, with plastic sleeve:
upper level (A/B terminals): 0.5 to $1.5 \mathrm{~mm}^{2}$ cross section lower level (W/X/Y/Z terminals): $0.5 \mathrm{~mm}^{2}$ cross section.
- Recommended torque for the terminal screws is 0.5 to 0.6 Nm .

## Disconnect-Style Interposing I/O Terminals, Wiring for Modules with One Group per Row

This wiring format generally applies when the associated VersaMax module provides for connection of I/O in 16-point groups. An example of such a module is the VersaMax 24VDC 16pt Output Module, IC200MDL740:

When connecting an Interposing Disconnect base in this format, follow these guidelines:

- Connect the field devices to A1-A16 (or B1-B16 where appropriate)
- Connect the return wires of field devices to the corresponding common connections A 1 to $\mathrm{W} 1, \mathrm{~A} 2$ to $\mathrm{W} 2, \mathrm{~A} 9$ to $\mathrm{X} 1, \mathrm{~A} 10$ to X 2 , etc.
- Connect jumpers between the A17, W, and X terminals (or B17, Y, and Z)
- Connect the power supply between A17 and A18 (or B17 and B18)

## Example: Wiring for Output Module IC200MDL740

Example field wiring for IC200CHS101 when used with VersaMax modules with 1 group per terminal row

## Disconnect-Style Interposing I/O Terminals, Wiring for Modules with Two Groups per Row

This wiring format generally applies when the associated VersaMax module provides for connection of I/O in 8-point groups. An example of such a module is the VersaMax 24VDC 16pt Input Module, IC200MDL640:

A

When connecting the Interposing Disconnect bases in this format, follow these guidelines:

- Connect field devices to A1-A16 (or B1-B16 where appropriate)
- Connect return wires of field devices to the corresponding common connections - A1 to $\mathrm{W} 1, \mathrm{~A} 2$ to $\mathrm{W} 2, \mathrm{~A} 9$ to $\mathrm{X} 1, \mathrm{~A} 10$ to X 2 , etc.
- Connect jumpers between the A17, W, and X terminals (or B17, Y, and Z).
- Connect power supply between A17 and W (or B17 and Y).
- Connect power supply between A18 and X (or B18 and Z).

## Example Wiring Diagram for Module IC200MDL640

Example field wiring for IC200CHS101 when used with VersaMax modules with 2 groups per terminal row

## Disconnect-Style Interposing I/O Terminals, Wiring for Modules with Connections that are Not Grouped

This wiring format generally applies when the associated VersaMax module provides for connection of isolated I/O devices, but may also be used when a non-isolated module provides dedicated terminals for each common connection. An example of an isolated module is the VersaMax 120VAC 8pt Isolated Input Module, IC200MDL143:

When connecting the Interposing Disconnect bases in this format, additional jumpers are usually not needed. Field wiring is connected to terminals A1-A16 (or B1-B16 where appropriate). The auxiliary terminals are not generally connected.

## Example Wiring Diagram for Module IC200MDL143

Example field wiring for IC200CHS101 when used with VersaMax modules without grouped points.

## Installating Relay-Style Interposing I/O Terminals IC200CHS111 and IC200CHS112

The Relay-Style Interposing I/O Terminals (IC200CHS111 and IC200CHS112) each provide dry contacts capable of switching high current outputs (up to 8A). For the Relay Style Interposing I/O Terminals, power for operation of the relay coils must be provided by an external 24VDC power supply. This power must be provided to both the main base (IC200CHS111) and the expansion base (IC200CHS112). Connection of this external power supply is made at the terminals A17 \& A18 (B17 \& B18 for the expansion base). This power connection is for the relay coils only. User loads must be powered by an external source.
Components labeled A1-A16 correspond to points Q1-Q16. Components labeled B1-B16 correspond to points Q17-Q32. Each point is associated with 3 terminal connections, labeled NO (Normally Open), C (Common), and NC (Normally Closed). Loads may be connected between C and NO, C and NC , or both.

## Relay-Style Interposing I/O Terminals, Terminal Wiring

Each terminal accommodates:

- One solid ( 0.2 to $4.0 \mathrm{~mm}^{2}$ cross section) or stranded ( 0.2 to $2.5 \mathrm{~mm}^{2}$ cross section), AWG \#12 to AWG \#24.
When inserting two wires in the same position, the wires must be the same size and type (solid or stranded), as specified below:
- Rigid or flexible wires: 0.2 to $1.5 \mathrm{~mm}^{2}$ cross section.
- Stranded wires with ferrules, no plastic sleeve: 0.25 to $0.75 \mathrm{~mm}^{2}$ cross section
- Stranded wires with twin ferrule, with plastic sleeve

Recommended torque for the terminal screws is 0.5 to 0.6 Nm .

## Wiring for Auxiliary I/O Terminals

Auxiliary I/O Terminals can be used to provide extra field wiring connections if needed. They can be attached to either a terminal-style I/O carrier or to Interposing I/O Terminals. Auxiliary I/O Terminals units are available with 18 box-style terminals (as shown below) or with 18 spring style terminals or 12 barrier-style terminals.

The terminals are electrically tied together. There is no electrical connection from the I/O Carrier or Interposing Terminals to the Auxiliary I/O Terminals; any necessary electrical reference must be provided. Multiple Auxiliary I/O Terminals can be connected together to provide the additional wiring terminals that may be needed for high-density modules, or for 2-, 3-, and 4-wire field devices.

| Field Device | Diagram | 16 Point Module |  | 32 Point Module |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Box-, Spring-, or Connector Carrier | Barrier-Style Carrier | Box-, Spring-, or Connector Carrier | Barrier-Style Carrier |
| 1-wire | Point | no Auxiliary Terminals |  |  |  |
| 2-wire |  | 1 Auxiliary Terminals * | 3 Auxiliary Terminals | 2 Auxiliary Terminals * | 3 Auxiliary Terminals |
| 3-wire |  | 2 Auxiliary Terminals * | 6 Auxiliary Terminals | 4 Auxiliary Terminals * | 6 Auxiliary Terminals |
| 4-wire |  | 3 Auxiliary Terminals * | 9 Auxiliary Terminals | 6 Auxiliary Terminals * | 9 Auxiliary Terminals |

* for 16-point modules that only use one row of terminals for point wiring, a shorting bar may be used to provide extra terminals. See the heading Using A Shorting Bar in this chapter.

For example, a 16-point module might use 3 Auxiliary I/O Terminals for 4-wire devices:

Auxiliary I/O Terminals accommodate current levels up to 8 Amps and voltage up to 264 VAC. Voltage transients up to 300 VAC will not cause damage.

## Installing Auxiliary I/O Terminals

Auxiliary I/O Terminals are installed by inserting the tabs into the slots on the I/O Carrier or Interposing Terminals and pressing downward. Screws can be inserted through the panel-mount holes for added stability if needed.

Auxiliary Carriers must be installed on the I/O Carrier or Interposing Terminals before connecting field wiring.

## Wire Specifications for Auxiliary I/O Terminals

Wire specifications depend on the terminal type. For box-type or spring type terminals, each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

For barrier-type terminals, each terminal accommodates one or two solid or stranded wires from AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) to AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section).
Use copper wire rated for 90 degrees $C$. When inserting two wires in the same position, the wires must be the same size and type (solid or stranded).

## Using Shorting Bars

Shorting Bars (part number IC200ACC303, quantity 2) can be a cost-effective solution for providing additional bussed terminals for modules that include only one I/O board. The shorting bar has a maximum current-carrying capacity of 2 Amps per point. See the individual module descriptions to determine whether a shorting bar can be used for a particular module.
The figures below show how a Shorting Bar can be used on a 2-row or 3-row carrier to provide extra field wiring connections for an I/O module.

| Example Connection for Carriers with Two Rows of Terminals |  |
| :---: | :---: |
| Example Connection for Carriers with Three Rows of Terminals |  |

A Shorting Bar must be installed directly on the carrier before installing the I/O module.

With a Shorting Bar in place, the unused terminals on the I/O Carrier or Interposing I/O
Terminals unit can be used in the same way as the Auxiliary I/O Terminals described earlier.

| Field Device | Diagram | 16 Point Module |  |  |  | 32 Point Module |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Box-, Spring-, or Connector Carrier | Barrier- <br> Style <br> Carrier | Box-, Spring-, or Connector Carrier with a Shorting Bar | Barrier-Style Carrier with a Shorting Bar | Box-, Spring-, or Connector Carrier | Barrier-Style Carrier |
| 1-wire | Point $\longrightarrow$ | no Auxiliary Terminals |  |  |  |  |  |
| 2-wire |  | 1 Auxiliary Terminals | 3 Auxiliary Terminals | no Auxiliary Terminals | Right side of barrier terminals on I/O Carrier | 2 Auxiliary Terminals | 3 Auxiliary Terminals |
| 3-wire |  | 2 Auxiliary Terminals | 6 Auxiliary Terminals | 1 Auxiliary Terminals | 3 Auxiliary Terminals | 4 Auxiliary Terminals | 6 Auxiliary Terminals |
| 4-wire |  | 3 Auxiliary Terminals | 9 Auxiliary Terminals | 2 Auxiliary Terminals | 6 Auxiliary Terminals | 6 Auxiliary Terminals | 9 Auxiliary Terminals |

## 2

## Installing Modules

## Setting the Carrier Keying

Keying dials on the carrier must be used to assure that the correct module type will be installed on that carrier. One dial selects alphabetic characters and the other selects numbers. These dials must be set to match the factory keying on the underside of the module. Module keying assignments are listed in appendix D.

## Installing a Module on a Carrier

Note: Before installing a module in an operating system, refer to the information below about Module Hot Insertion and Removal.
The latch on the module must be in the unlocked position as illustrated to install a module on its carrier.

Align the three T-shaped projections on the module side with the slots on the carrier and align the latch post on the module with the hole on the carrier.

Press the module straight down onto the carrier, seating it fully.
Turn the latch to the locked position to secure the module to the top of the carrier.

## Hot Insertion and Removal of I/O Modules

If external power to an I/O module's field devices is removed, the module itself can be removed/inserted in an operating system (backplane power and CPU or NIU active) without affecting the rest of the system. Communications modules are not hot-insertable or removable.

For hot insertion, the I/O module must be properly seated on the carrier with all pins connected within 2 seconds. For removal, the module must be completely disengaged from the carrier within 2 seconds. If hot insertion or removal takes longer than 2 seconds, a System Misconfiguration fault may be generated, which may shut down the I/O Station.

## CAUTION

Operating equipment may be very hot, especially at higher ambient temperatures. If the equipment is hot, do not touch it directly.

Such "hot insertion" and removal should not be attempted in hazardous locations. Personal injury, system malfunction and/or damage to the equipment may occur.
VersaMax equipment is suitable for use in non-hazardous locations or in Class 1, Div. 2, Groups A, B, C, and D, and Class 1 Zone 2 locations.
Explosion hazard: Substitution of components may impair suitability for Class 1, Division 2 and Class 1 Zone 2.

## NOTE

The VersaMax power supply is not hot-swappable. Hot inserting or extracting the power supply is an improper method to power-down or power-up. Hot inserting the power supply can cause a "Corrupted User Memory Fault" condition. Power-cycling should only be accomplished by switching the main power going into the power-supply.

## Chapter 3

 Power SuppliesThis chapter describes the VersaMax power supply modules. See chapter 4 for information about the Power Supply Booster Carrier, which can be used to install an additional "booster" power supply in the system.

| - | IC200PWR001 | 24VDC Power Supply |
| :--- | :--- | :--- |
| - | IC200PWR002 | 24VDC Expanded 3.3V Power Supply |
| - | IC200PWR101 | 120/240VAC Power Supply |
| - | IC200PWR102 | 120/240VAC Expanded 3.3V Power Supply |
| - | IC200PWR201 | 12VDC Power Supply |
| - | IC200PWR202 | 12VDC Expanded 3.3V Power Supply |

## IC200PWR001 <br> 24VDC Power Supply

24VDC Power Supply IC200PWR001 provides backplane power for CPU, NIU, and I/O modules. It supplies up to 1.5 Amps output current via 3.3 volt and 5 volt outputs, with up to 0.25 Amp on the 3.3 Volt output. This is ample power for most installations. Module backplane current consumption is summarized in appendix C .

When mounted on the CPU or NIU module, it serves as the main power supply for the station. It can also be used as a supplemental power supply when mounted on a Power Supply Booster Carrier. Refer to the Power Supply Booster Carrier section of chapter 4 for more information.
IC200PWR001
24VDC Power Supply

## Specifications

| Input Voltage | 18 to 30VDC, 24VDC nominal |
| :--- | :--- |
| Input Power | 11 W |
| Holdup Time | 10 ms |
| Inrush Current | 20A at 24VDC <br>  <br>  <br> 25A at 30 VDC |
| Output Voltage | 5VDC, 3.3VDC |
| Protection | Short circuit, overload, reverse polarity |
| Output Current |  |
| Total | 1.5 A maximum |
| 3.3VDC Output | 0.25 A maximum |
| 5VDC Output | $\left(1.5 \mathrm{~A}-\mathrm{I}_{3.3 \mathrm{~V}}\right)$ maximum |

- The total output current should not exceed 1.5A. For example, if 3.3V @ 0.25 A is required, 1.25 A is available on the 5 V output.

## Wiring

DC- must be grounded to frame / earth ground. DC- is grounded to frame internally in the Power Supply. As a result, floating power supplies cannot be used.

## IC200PWR002 <br> 24VDC Expanded 3.3 V Power Supply

24VDC Expanded 3.3V Power Supply IC200PWR002 provides backplane power for CPU, NIU, and I/O modules. It supplies up to 1.5 Amps output current via 3.3 volt and 5 volt outputs, with up to 1.0 Amp on the 3.3 Volt output. Module backplane current consumption is summarized in appendix C .

When mounted on the CPU or NIU module, it serves as the main power supply for the station. It can also be used as a supplemental power supply when mounted on a Power Supply Booster Carrier. Refer to the Power Supply Booster Carrier section of chapter 4 for more information.

| IC200PWR002 |
| ---: |
| 24VDC Expanded 3.3 V Power Supply |

## Specifications

| Input Voltage | 18 to 30 VDC, 24VDC nominal |
| :--- | :--- |
| Input Power | 11 W |
| Holdup Time | 10 ms |
| Inrush Current | 20A at 24VDC <br>  <br>  <br> 25A at 30 VDC |
| Output Voltage | $5 \mathrm{VDC}, 3.3 \mathrm{VDC}$ |
| Protection | Short circuit, overload, reverse polarity |
| Output Current |  |
| Total <br> 3.3VDC Output <br> 5VDC Output | 1.5 A maximum $\bullet$ |

- The total output current should not exceed 1.5A. For example, if 3.3V @ 1.0A is required, 0.5 A is available on the 5 V output.

## Wiring

DC- must be grounded to frame / earth ground. DC- is grounded to frame internally in the Power Supply. As a result, floating power supplies cannot be used.

## IC200PWR101 <br> 120/240VAC Power Supply

120/240VAC Power Supply IC200PWR101 provides backplane power for CPU, NIU, and I/O modules. It supplies up to 1.5 Amps output current via 3.3 Volt and 5 Volt outputs, with up to 0.25 Amp on the 3.3 volt output. This is ample power for most installations. Module backplane current consumption is summarized in appendix C .

When mounted on the CPU or NIU module, this power supply serves as the main power supply for the station. It can also be used as a supplemental power supply when mounted on a Power Supply Booster Carrier. Refer to the Power Supply Booster Carrier section of chapter 4 for more information.

## IC200PWR101 <br> 120/240VAC Power Supply

## Specifications

| Input Voltage | 85 to 132 VAC with jumper installed, 120VAC nominal <br> 176 to 264 VAC w/o jumper installed, 240VAC nominal |
| :--- | :--- |
| Input Power | 27 VA |
| Frequency | 47 to 63 Hz |
| Holdup Time | 20 ms |
| Output Voltage | $5 \mathrm{VDC}, 3.3 \mathrm{VDC}$ |
| Protection | Short circuit, overload |
| Output Current |  |
| Total <br> 3.3VDC Output <br> 5VDC Output | 1.5A maximum |

- The total output current should not exceed 1.5 A . For example, if $3.3 \mathrm{~V} @ 0.25 \mathrm{~A}$ is required, 1.25 A is available on the 5 V output.

## Jumper Selection of 120VAC or 240VAC

This power supply can be used with either 120VAC or 240VAC nominal input power. For 120 VAC nominal operation, a jumper should be installed as marked on the power supply.

The power supply operates without a jumper installed; however, the hold-up specification is not met. If a jumper is not installed for 120 VAC operation, the power supply will not cause hazardous conditions.

## WARNING:

DO NOT USE A JUMPER FOR 240VAC OPERATION. If a jumper is used on the input connector for 240 VAC nominal operation, the power supply will be damaged and may cause hazardous conditions.

## IC200PWR102 <br> 120/240VAC Expanded 3.3V Power Supply

120/240VAC Expanded 3.3 Power Supply IC200PWR102 provides backplane power for CPU, NIU, and I/O modules. It supplies up to 1.5 Amps output current via 3.3 Volt and 5 Volt outputs, with up to 1.0 Amp on the 3.3 V output. Module backplane current consumption is summarized in appendix C .

When mounted on the CPU or NIU module, this power supply serves as the main power supply for the station. It can also be used as a supplemental power supply when mounted on a Power Supply Booster Carrier. Refer to the Power Supply Booster Carrier section of chapter 4 for more information.

## Specifications

| Input Voltage | 85 to 132 VAC with jumper installed, 120VAC nominal <br> 176 to 264 VAC w/o jumper installed, 240VAC nominal |
| :--- | :--- |
| Input Power | 27 VA |
| Frequency | 47 to 63 Hz |
| Holdup Time | 20 ms |
| Output Voltage | $5 \mathrm{VDC}, 3.3 \mathrm{VDC}$ |
| Protection | Short circuit, overload |
| Output Current |  |
| Total | 1.5 A maximum $\bullet$ |
| 3.3VDC Output | 1.0 A maximum <br> 5VDC Output |

- The total output current should not exceed 1.5 A . For example, if 3.3 V @ 1.0 A is required, 0.5 A is available on the 5 V output.

## Jumper Selection of 120VAC or 240VAC

This power supply can be used with either 120VAC or 240VAC nominal input power. For 120VAC nominal operation, a jumper should be installed as marked on the power supply.

The power supply operates without a jumper installed; however, the hold-up specification is not met. If a jumper is not installed for 120 VAC operation, the power supply will not cause hazardous conditions.

## WARNING:

DO NOT USE A JUMPER FOR 240VAC OPERATION. If a jumper is used on the input connector for 240 VAC nominal operation, the power supply will be damaged and may cause hazardous conditions.

## IC200PWR201 <br> 12VDC Power Supply

12VDC Power Supply IC200PWR201 provides backplane power for CPU, NIU, and I/O modules. It supplies up to 1.5 Amps output current via 3.3 volt and 5 volt outputs, with up to 0.25 Amp on the 3.3 Volt output. This is ample power for most installations. Module backplane current consumption is summarized in appendix C .

When mounted on the CPU or NIU module, it serves as the main power supply for the station. It can also be used as a supplemental power supply when mounted on a Power Supply Booster Carrier. Refer to the Power Supply Booster Carrier section of chapter 4 for more information.

| IC200PWR201 |

| Output Current |  |
| Total | 1.5A maximum |
| 3.3VDC Output | 1.0 A maximum |
| 5VDC Output | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V}}\right)$ maximum |

The total output current should not exceed 1.5 A . For example, if $3.3 \mathrm{~V} @ 1.0 \mathrm{~A}$ is required, 0.5 A is available on the 5 V output.

## Wiring

DC- must be grounded to frame / earth ground. DC- is grounded to frame internally in the Power Supply. As a result, floating power supplies cannot be used.

## Chapter

Carriers

This chapter describes the Carriers that provide mounting and backplane communications for VersaMax modules.

- IC200CHS001 Barrier-Style I/O Carrier
- IC200CHS002 Box-Style I/O Carrier
- IC200CHS003 Connector-Style I/O Carrier
- IC200CHS005 Spring-Style I/O Carrier
- IC200CHS022 Compact Box-Style I/O Carrier
- IC200CHS025 Compact Spring-Style I/O Carrier
- IC200CHS006 Communications Carrier
- IC200PWB001 Power Supply Booster Carrier

## IC200CHS001

Barrier-Style I/O Carrier

The Barrier-Style I/O Carrier (IC200CHS001) has 36 barrier-style terminals. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts lengthwise (parallel to the DIN rail) on this carrier.

## IC200CHS001

Barrier-Style I/O Carrier

## Din Rail Mounting

The I/O carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- The Barrier-Style I/O carrier supports wiring for up to 32 I/O points and 4 common/power connections.
- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys are set to match the keying on the bottom of the module. A complete list of module keying assignments is included in appendix D .
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- A clear protective hinged door covering the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.
- Notches on the lower edge for attaching an Auxiliary I/O Terminal Strip if extra bussed connection points are needed.

## IC200CHS001

Barrier-Style //O Carrier

## Field Wiring Terminals

Each terminal accommodates one or two solid or stranded wires from AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) to AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section).

$$
\begin{aligned}
& \text { A13 A14) A15 A16 A17 A18 A13 B14 B15 B16 B17 B18 } \\
& \text { A7 A8 A9 A10 A11 A12 A7 B8 B9 B10 B11 B12 } \\
& \text { A1 A2 A3 A4 A5 A6 B1 B2 B3 B4 B5 B6 }
\end{aligned}
$$

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

One or more Auxiliary I/O Terminal Strips can be added to provide extra field wiring connections if needed. Auxiliary I/O Terminal Strips insert directly into the lower edge of the I/O Carrier.

The Box-Style I/O Carrier (IC200CHS002) has 36 IEC box-style terminals. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts lengthwise (parallel to the DIN rail) on this carrier.

## IC200CHSOO2

Box-Style //O Carrier

## Din Rail Mounting

The I/O carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- The Box-Style I/O carrier supports wiring for up to 32 I/O points and 4 common/power connections.
- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys are set to match the keying on the bottom of the module. A complete list of module keying assignments is included in appendix D .
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- A clear protective hinged door covering the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.
- Notches on the lower edge for attaching an Auxiliary I/O Terminal Strip if extra bussed connection points are needed.

| IC200CHSO02 |
| ---: |
| Box-Style I/O Carrier |

## Field Wiring Terminals

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

One or more Auxiliary I/O Terminal Strips can be added to provide extra field wiring connections if needed. Auxiliary I/O Terminal Strips insert directly into the lower edge of the I/O Carrier.

## IC200CHSO03 <br> Connector-Style I/O Carrier

The Connector-Style I/O Carrier (IC200CHS003) has a 36 -pin connector for attaching an I/O cable. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts vertically (perpendicular to the DIN rail) on this carrier.

## IC200CHSOO3

Connector-Style I/O Carrier

## Din Rail Mounting

The carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys are set to match the keying on the bottom of the module. A complete list of module keying assignments is included in appendix D .
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- Connector provides quick attachment of wiring for up to 32 I/O points and 4 common/power connections.

## IC200CHS003

## Connector-Style I/O Carrier

## Field Wiring Connection

I/O devices can be wired directly to Interposing I/O Terminals, described separately in this chapter, or other types of terminal strips.

Connection to the Connector Style I/O Carrier is made by cable. The following cables are available:

| IC200CBL105 | 2 connectors, 0.5 m , no shield |
| :--- | :--- |
| IC200CBL110 | 2 connectors, 1.0 m , no shield |
| IC200CBL120 | 2 connectors, 2.0 m , no shield |
| IC200CBL230 | 1 connector, 3.0 m , no shield |

The notch on the connector indicates the orientation of the pins.

A connector kit is available for building custom cables. The kit is part number IC200ACC304.

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

## Compatiblity

This carrier can be used with all VersaMax I/O modules EXCEPT the following, due to their high isolation requirements:

IC200MDL144 Input 240VAC 4 Point Isolated Module<br>IC200MDL244 Input 240VAC 8 Point Isolated Module<br>IC200MDD850 Mixed 240VAC Isolated 4 Point / Output Relay 2.0A<br>Isolated 8 Point Module

| IC200CHSO05 |
| ---: |
| Spring-Style I/O Carrier |

The Spring-Style I/O Carrier (IC200CHS005) has 36 spring-clamp style terminals for field wiring. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts lengthwise (parallel to the DIN rail) on this carrier.

## IC200CHSO05

## Spring-Style I/O Carrier

## Din Rail Mounting

The carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- The Spring-Style I/O Carrier supports up to 32 I/O points and 4 common/power connections.
- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys can be set to match the keying on the bottom of the module. A complete list of module keying is included in appendix D.
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- A clear protective hinged door covering the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.
- Notches on the lower edge for attaching an Auxiliary I/O Terminal Strip if extra bussed connection points are needed.

## IC200CHS005

Spring-Style I/O Carrier

## Field Wiring Terminals

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

One or more Auxiliary I/O Terminal Strips can be added to provide extra field wiring connections if needed. Auxiliary I/O Terminal Strips insert directly into the lower edge of the I/O Carrier.

## IC200CHSO22 <br> Compact Box-Style I/O Carrier

The Compact Box-Style I/O Carrier (IC200CHS022) has 36 IEC box-style terminals. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts vertically (perpendicular to the DIN rail) on this carrier.

## IC200CHSO22

Compact Box-Style I/O Carrier

## Din Rail Mounting

The I/O carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- The Compact Box-Style I/O carrier supports wiring for up to 32 I/O points and 4 common/power connections.
- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys are set to match the keying on the bottom of the module. A complete list of module keying assignments is included in appendix D .
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- A printed wiring card provided with each I/O module can be folded and inserted in the built-in card holder.

## IC200CHS022

## Compact Box-Style I/O Carrier

## Field Wiring Terminals

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

$$
\begin{aligned}
& \text { (A13 A14 A15 A16 A17 A18 B13 B14 B15 B16 B17 B18 } \\
& \text { (A7) A8 A9 A10 A11 A12 B7 B8 B9 B10 B11 B12 }
\end{aligned}
$$

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

## Wiring Card Holder

The Compact I/O Carrier has a built-in card holder that hinges down over the terminal wiring. The wiring card provided with the I/O module can be inserted in the holder. During system operation, the card holder should be in the retracted position.

| IC200CHSO25 |
| ---: | ---: |
| Compact Spring-Style I/O Carrier |

The Compact Spring-Style I/O Carrier (IC200CHS025) has 36 IEC box-style terminals. It provides mounting, backplane communications, and field wiring for one I/O module.

The I/O module mounts vertically (perpendicular to the DIN rail) on this carrier.

## IC200CHSO25

Compact Spring-Style I/O Carrier

## Din Rail Mounting

The I/O carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- The Compact Spring-Style I/O carrier supports wiring for up to 32 I/O points and 4 common/power connections.
- Easily-set keying dials to assure installation of the correct type of module on the carrier. Keys are set to match the keying on the bottom of the module. A complete list of module keying assignments is included in appendix D .
- Carrier-to-carrier mating connectors for quick installation of the backplane connection with no additional cables or tools needed.
- Module latch hole for securely fastening the module to the carrier.
- A printed wiring card provided with each I/O module can be folded and inserted in the built-in card holder.

## IC200CHSO25

Compact Spring-Style I/O Carrier

## Field Wiring Terminals

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

The carrier accommodates current levels up to 2 Amps per point or 8 Amps per each power and ground, and a voltage range of up to 264 VAC. Voltage transients up to 300 VAC will not damage the carrier.

## Wiring Card Holder

The Compact I/O Carrier has a built-in card holder that hinges down over the terminal wiring. The wiring card provided with the I/O module can be inserted in the holder. During system operation, the card holder should be in the retracted position.

## IC200CHS006 <br> Communications Carrier

The Communications Carrier (IC200CHS006) provides mounting and backplane communications and field wiring for a fieldbus communications module.

## Din Rail Mounting

The carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Features

- Compatible with all VersaMax fieldbus communications modules.
- Fast DIN-rail mounting.
- Can be located in any "slot".
- Module latch hole for securely fastening the module to the carrier.

| IC200PWB001 |
| ---: |
| Power Supply Booster Carrier |

Power Supply Booster Carrier IC200PWB001 can be used to mount an additional power supply in sequence with other module carriers. A power supply mounted on a booster carrier provides power to all I/O modules to its right, or until the next booster power supply. The AC or DC Power Supply on the CPU or NIU and the Power Supply that resides on the Booster Carrier must share the same external power source.

## IC200PWB001 <br> Power Supply Booster Carrier

## LED Indicators

Two LEDs on the Power Supply Booster Carrier indicate its status.

PWR indicates that the attached booster power supply is functioning properly.

OK indicates that the CPU or NIU and attached booster power supply are functioning properly.

## Din Rail Mounting

The Power Supply Booster Carrier snaps easily onto a 7.5 mm X 35 mm DIN rail. The DIN rail must be electrically grounded to provide EMC protection. The rail must have a conductive (unpainted) corrosion-resistant finish.

For applications requiring maximum resistance to mechanical vibration and shock, the carrier must also be panel-mounted. See chapter 2 for installation instructions.

## Chapter 5

This chapter describes the Interposing I/O Terminals and Auxiliary I/O Terminal Strips that provide field wiring connections for I/O modules.

- IC200CHS011 Barrier-Style Interposing I/O Terminals
- IC200CHS012 Box-Style Interposing I/O Terminals
- IC200CHS014 Thermocouple-Style Interposing I/O Terminals
- IC200CHS015 Spring-Style Interposing I/O Terminals
- IC200CHS101 Disconnect-Style Interposing I/O Terminals, Main Base
- IC200CHS102 Disconnect-Style Interposing I/O Terminals, Expansion Base
- IC200CHS111 Relay-Style Interposing I/O Terminals, Main Base
- IC200CHS112 Relay-Style Interposing I/O Terminals, Expansion Base
- IC200TBM001 Barrier-Style Auxiliary I/O Terminal Strip
- IC200TBM002 Box-Style Auxiliary I/O Terminal Strip
- IC200TBM005 Spring-Style Auxiliary I/O Terminal Strip

## IC200CHS011 <br> Barrier-Style Interposing I/O Terminals

The Barrier-Style Interposing I/O Terminals (IC200CHS011) interface a Connector-Style I/O Carrier to field wiring. The unit has a connector for attaching a cable from the Connector-Style I/O Carrier and 36 barrier-style terminals.

Each terminal accommodates one or two solid or stranded wires up to AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section. A clear protective hinged door covers the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.

## IC200CHS011 <br> Barrier-Style Interposing I/O Terminals

## Din Rail Mounting

The Interposing I/O Terminals unit can be mounted on the same DIN rail as the Connector-Style I/O Carrier, or on a separate DIN rail as illustrated below. For applications requiring maximum resistance to mechanical vibration and shock, the Interposing I/O Terminals must also be panel-mounted. See chapter 2 for installation instructions.

## IC200CHSO12 <br> Box-Style Interposing I/O Terminals

The Box-Style Interposing I/O Terminals (IC200CHS012) interface a Connector-Style I/O Carrier to field wiring. The unit has a connector for attaching a cable from the ConnectorStyle I/O Carrier and 36 box-style terminals.

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). A clear protective hinged door covers the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.

| IC200CHS012 |
| ---: |
| Box-Style Interposing I/O Terminals |

## Din Rail Mounting

The Interposing I/O Terminals unit can be mounted on the same DIN rail as the Connector-Style I/O Carrier, or on a separate DIN rail as illustrated below. For applications requiring maximum resistance to mechanical vibration and shock, the Interposing I/O Terminals unit must also be panel-mounted. See chapter 2 for installation instructions.

## IC200CHS014 <br> Thermocouple Compensation Box-Style Interposing I/O Terminals

The Thermocouple Compensation Box-Style Interposing I/O Terminals (IC200CHS014) interface a Connector-Style I/O Carrier to field wiring from thermocouples. The unit has a connector for attaching a cable from the Connector-Style I/O Carrier and 36 box-style terminals. It includes a built-in thermistor that provides Local Cold Junction Compensation for thermocouple input measurements.

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). A clear protective hinged door covers the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.

## Din Rail Mounting

The Interposing I/O Terminals unit can be mounted on the same DIN rail as the Connector-Style I/O Carrier, or on a separate DIN rail as illustrated below. For applications requiring maximum resistance to mechanical vibration and shock, the Interposing I/O Terminals unit must also be panel-mounted. See chapter 2 for installation instructions.

## IC200CHS015

## Spring-Style Interposing I/O Terminals

The Spring-Style Interposing I/O Terminals (IC200CHS015) interface a Connector-Style I/O Carrier to field wiring. It has a connector for attaching a cable from the ConnectorStyle I/O Carrier and 36 spring-clamp style terminals.

Each terminal accommodates one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section). A clear protective hinged door covers the wiring terminals. The printed wiring card provided with each I/O module can be folded and inserted in this door.

| IC200CHS015 |

## Din Rail Mounting

The Interposing I/O Terminals can be mounted on the same DIN rail as the ConnectorStyle I/O Carrier, or on a separate DIN rail as illustrated below. For applications requiring maximum resistance to mechanical vibration and shock, the Interposing I/O Terminals must also be panel-mounted. See chapter 2 for installation instructions.

## IC200CHS101, Main Base <br> IC200CHS102, Expansion Base <br> Disconnect-Style Interposing I/O Terminals

The Disconnect-Style Interposing I/O Terminals (IC200CHS101 and IC200CHS102) interface a VersaMax Connector-Style I/O Carrier to field wiring and provide an integrated disconnect option for field devices connected to VersaMax I/O modules.

Each device connected to the VersaMax I/O module may be individually disconnected from the control circuit by opening one of the two switches (signal or return) associated with it. In this way, specific inputs or outputs maybe taken "off line" without altering system wiring or affecting the balance of the installation.

## Main and Expansion Base

Two different versions of the Disconnect-Style Interposing I/O Terminals are available, the main and expansion bases. The Main Base, IC200CHS101, provides terminals that correspond to the "A" terminals on a VersaMax I/O module. If the I/O module also has "B" terminals, an Expansion Base, IC200CHS102) is also needed.

## Main Base, IC200CHS101 <br> Expansion Base, IC200CHS102 <br> Disconnect-Style Interposing I/O Terminals

## Main Base - IC200CHS101

This Interposing Disconnect Base has a connector (J1) for attaching a cable from the Connector-Style I/O Carrier and 36 box-style terminals for field I/O wiring and power connections. The I/O Interposing Disconnect Base also has an expansion connector (J2) that can be used to attach to an Interposing Disconnect Expansion Base (IC200CHS102).

This base provides connection for the terminals on the "A" side of the VersaMax connector (A1-A18). Two groups of common terminals (W1-W8 and X1-X8) can be used for connecting two-wire devices without additional auxiliary terminal blocks.

The base has an individual knife-switch disconnect for each signal and common terminal and its corresponding pin on the VersaMax cable connector.

## IC200CHS101, Main Base

IC200CHS102, Expansion Base

## Disconnect-Style Interposing I/O Terminals

## Expansion Base - IC200CHS102

The Interposing Disconnect Expansion Base has a connector (J2) for attaching a ribbon cable to the expansion connector of the Main Base (IC200CHS101) and 36 box-style terminals for field I/O wiring and power connections. The Expansion base includes a ribbon cable for connecting the expansion base to the main base.

The Expansion Base provides connection for terminals on the " $B$ " side of the VersaMax connector (B1-B18). In addition, it has two groups of common terminals (Y1-Y8 and Z1Z8) for connecting two-wire devices without additional auxiliary terminal blocks.

The base has an individual knife-switch disconnect for each signal and common terminal and its corresponding pin on the VersaMax cable connector.

## Main Base, IC200CHS101 Expansion Base, IC200CHS102 Disconnect-Style Interposing I/O Terminals

## Compatible I/O Modules

The following table provides a guideline for selecting the appropriate bases and wiring formats for VersaMax I/O modules. Modules that are incompatible with these Interposing Disconnect Bases are indicated by shaded entries in the table.

|  | 1 Group /Row | 2 Groups /Row | Not Grouped | CHS101 | CHS102 | Notes |

## IC200CHS111, Main Base <br> IC200CHS112, Expansion Base <br> Relay-Style Interposing I/O Terminals

The Relay-Style Interposing I/O Terminals (IC200CHS111 and IC200CHS112) each provide dry contacts capable of switching high current outputs (up to 8A). The relays on these interposing terminals are intended to be controlled with standard 24VDC 0.5 A VersaMax output modules (IC200MDL740 and IC200MDL750). Each relay is replaceable, individually fused, and includes status indication.

## Main and Expansion Base

Two different versions of the Relay-Style Interposing I/O Terminals are available, the main and expansion bases. The Main Base, IC200CHS111, is for use with the 16 point VersaMax module (IC200MDL740) or points 1-16 of the 32 point VersaMax module (IC200MDL750). The Expansion Base, IC200CHS112, is for use with points 17-32 of the 32 point VersaMax module (IC200MDL750).

## Main Base, IC200CHS111 Expansion Base, IC200CHS112 Relay-Style Interposing I/O Terminals

## Main Base - IC200CHS111

The Interposing Relay Base has a connector (J1) for attaching a cable from the ConnectorStyle I/O Carrier (IC200CHS003) and 50 box-style terminals for field I/O wiring and power connections. The Interposing Relay Base also has an expansion connector (J2) that can be used to attach to an Interposing Relay Expansion Base (IC200CHS112).

## Expansion Base - IC200CHS112

The Interposing Relay Expansion Base has a connector (J2) for attaching a ribbon cable to the expansion connector of the Main Base (IC200CHS111) and 50 box-style terminals for field I/O wiring and power connections. The Expansion base includes a ribbon cable for connecting the expansion base to the main base.

## IC200CHS111, Main Base <br> IC200CHS112, Expansion Base <br> Relay-Style Interposing I/O Terminals

## Field Wiring

Power for operation of the relay coils must be provided by an external 24VDC power supply. This power must be provided to both the main base and the expansion base. Connection of this external power supply is made at the terminals A17 \& A18 (B17 \& B18 for the expansion base). This power connection is for the relay coils only. User loads must be powered by an external source.

Each relay, status LED and fuse is labeled to indicate the specific point on the VersaMax output module they are associated with. Components labeled A1-A16 correspond to points Q1-Q16. Components labeled B1-B16 correspond to points Q17-Q32. Each point is associated with 3 terminal connections, labeled NO (Normally Open), C (Common), and NC (Normally Closed). User loads may be connected between C and NO, C and NC, or both.

## Main Base, IC200CHS111 Expansion Base, IC200CHS112 Relay-Style Interposing I/O Terminals

## Relay Specifications

The field-replaceable, form-C relay used in IC200CHS111 and IC200CHS112 is manufactured by Omron Electronics (part number G2R-14). The relay has the following specifications:

| Contact Ratings |  |  |
| :---: | :---: | :---: |
| Number of Poles | 1 Pole |  |
| Load | Resistive Load ( $\cos \Phi=1$ ) | Inductive Load $(\cos \Phi=0.4, \mathrm{~L} / \mathrm{R}=7 \mathrm{~ms})$ |
| Rated Load | 8 A at 250 VAC 8 A at 30 VDC | 6 A at 250 VAC <br> 4A at 30VDC |
| Rated Carry Current | 8A |  |
| Max Switching Voltage | 380VAC, 125VDC |  |
| Max Switching Current | 8A |  |
| Max Switching Power | 2,000VA, 240W | 1,500VA, 120W |
| Min Permissible Load | 100 mA at 5VDC |  |

| Characteristics |  |  |
| :---: | :---: | :---: |
| Contact Resistance | $30 \mathrm{~m} \Omega$ max |  |

## IC200TBM001 <br> Barrier-Style Auxiliary I/O Terminal Strip

The Barrier-Style Auxiliary I/O Terminal Strip (IC200TBM001) has two groups of 6 internally-bussed barrier-style wiring terminals. The two groups are isolated from each other. It can be used to provide extra field wiring connections for terminal-style I/O Carriers and Interposing I/O Terminals.

Mounting tabs on the upper edge of the Auxiliary I/O Terminal Strips insert in slots on the bottom of the I/O Carrier or Interposing I/O Terminals for fast, convenient installation. Additional Auxiliary I/O Terminal Strips can be connected in the same way. The Auxiliary I/O Terminal Strip also has panel-mount holes for added stability in high-vibration locations.

The Auxiliary I/O Terminal Strip can accommodate current levels up to 8 Amps and voltage up to 264 VAC. Voltage levels up to 300VAC will not damage the unit.

There is no electrical connection from the Terminal-Style I/O Carrier or Interposing I/O Terminals to the Auxiliary I/O Terminal Strip; any necessary electrical reference must be provided.

## IC200TBM002

## Box-Style Auxiliary I/O Terminal Strip

The Box-Style Auxiliary I/O Terminal Strip (IC200TBM002) has 18 internally -bussed IEC box-style wiring terminals. It can be used to provide extra field wiring connections for terminal-style I/O Carriers and Interposing I/O Terminals.

Mounting tabs on the upper edge of the Auxiliary I/O Terminal Strips insert in slots on the bottom of the I/O Carrier or Interposing I/O Terminals for fast, convenient installation. Additional Auxiliary I/O Terminal Strips can be connected in the same way. The Auxiliary I/O Terminal Strip also has panel-mount holes for added stability in high-vibration locations.

The Auxiliary I/O Terminal Strip can accommodate current levels up to 8 Amps and voltage up to 264 VAC. Voltage levels up to 300 VAC will not damage the unit.

There is no electrical connection from the Terminal-Style I/O Carrier or Interposing I/O Terminals to the Auxiliary I/O Terminal Strip; any necessary electrical reference must be provided.

## IC200TBM005 Spring-Style Auxiliary I/O Terminal Strip

The Spring-Style Auxiliary I/O Terminal Strip (IC200TBM005) has 18 internally -bussed spring-clamp style wiring terminals. It can be used to provide extra field wiring connections for terminal-style I/O Carriers and Interposing I/O Terminals.

Mounting tabs on the upper edge of the Auxiliary I/O Terminal Strips insert in slots on the bottom of the I/O Carrier or Interposing I/O Terminals for fast, convenient installation. Additional Auxiliary I/O Terminal Strips can be connected in the same way. The Auxiliary I/O Terminal Strip also has panel-mount holes for added stability in high-vibration locations.

The Auxiliary I/O Terminal Strip can accommodate current levels up to 8 Amps and voltage up to 264 VAC. Voltage levels up to 300VAC will not damage the unit.

There is no electrical connection from the Terminal-Style I/O Carrier or Interposing I/O Terminals to the Auxiliary I/O Terminal Strip; any necessary electrical reference must be provided.

## 5

## Chapter 6

## Expansion Modules

This chapter describes VersaMax expansion modules:

- IC200ETM001 Expansion Transmitter Module
- IC200ERM001 Expansion Receiver Module, Isolated
- IC200ERM002 Expansion Receiver Module, Non-isolated

## IC200ETM001 <br> Expansion Transmitter Module

The Expansion Transmitter Module IC200ETM001 (ETM) is used to expand a VersaMax PLC or NIU I/O station to include up to seven additional "racks" of VersaMax modules. Each expansion rack can include up to eight I/O and specialty modules, including the fieldbus communications modules.

The Expansion Transmitter Module has a pass-though serial programming port that can be used to upload firmware updates to an adjacent NIU.

## Features

- High speed bus expansion interface
- Serial firmware update interface for updating firmware in adjacent Network Interface Units (NIUs)
- Supports up to 7 expansion racks
- Two LEDs show module power status and expansion port status
- No DIP switches to set, easy software configuration into PLC system

## Connectors

The 26-pin female D-shell connector on the front of the Expansion Transmitter is the expansion port for connecting to an Expansion Receiver Module.

The 16-pin male connector on the upper left side of the Expansion Transmitter is the pass-though serial programming port. It can be used to upload firmware updates to an adjacent NIU.

## LED Indicators

The LEDs on the Expansion Transmitter show the status of power to the module and the status of the expansion port.

The PWR LED is On when the module is receiving 5VDC power from the CPU or NIU. It is Off when the module is detached from the CPU/NIU or when the CPU/NIU itself is not receiving power.

The EXP TX LED is either blinking or On when the Expansion Transmitter is communicating with the Bus Receiver Modules connected to it through the expansion bus link. It is Off when they are not communicating.

IC200ETM001
Expansion Transmitter Module

## Pass-Through Serial Port

When the Expansion Transmitter is connected to a Network Interface Unit (NIU) module in an I/O station, firmware upgrades to the NIU are performed via the Expansion Transmitter's pass-through serial port. (If there is no Expansion Transmitter installed, firmware upgrades are made via direct connection between the programmer and NIU, as shown first in the illustration below.) The same serial cable, IC200CBL002, is used in both cases.

## IC200ETM001

## Expansion Transmitter Module

## Module Specifications

| Module Characteristics |  |
| :---: | :---: |
| Module ID |  |

| Bus Transmitter Module Expansion Cable <br> Firmware Update Cable Terminator Plug Connector Kit | IC200ETM001 <br> IC200CBL601-1 meter <br> IC200CBL602-2 meters <br> IC200CBL615-15 meters <br> IC200CBL002 <br> IC200ACC201 (included with ETM) IC200ACC202 |

To make different length expansion cables, purchase the connector kit and use one of the following commercially-available cables: Belden 8108, Manhattan/CDT M2493, Alpha 3498C.

The Expansion Receiver Module, Isolated (IC200ERM001) interfaces an expansion "rack" to a VersaMax PLC or NIU I/O Station system. The expansion rack can include up to eight Versamax I/O and special-purpose modules. A VersaMax power supply installed on the Expansion Receiver Module provides operating power for the modules in the expansion rack. This module must be used with an Expansion Transmitter Module (IC200ERM001) in the PLC or I/O Station. The total overall length of the expansion cable can be up to 750 meters. This module provides up to 500 VDC isolation.

- High speed bus expansion interface
- Supports up to 7 expansion racks
- Supports Hold Last State
- System fault isolation
- Three LED indicators provide module power status and expansion port status
- No DIP switches to set, easy software configuration into PLC system
- Power supply mounts directly to module
- 500 VDC isolation

The Expansion Receiver Module supports hold last state operation of the output modules in the event of loss of communications with the CPU/NIU. It also permits isolation and repair of a faulty module within a rack.

## IC200ERM001

Expansion Receiver Module, Isolated

## Connectors

The Expansion Receiver has two 26-pin female D-shell expansion ports. The upper port receives the cable from an Expansion Transmitter or upstream Expansion Receiver Module. The lower port is used to daisy-chain the expansion cable to the next expansion rack or to attach the terminator plug at the last rack. The Expansion Receiver must always be installed in the leftmost position of the rack (slot 0 ).

## LED Indicators

Three LEDs show the status of module power, the expansion port, and the I/O modules.

The PWR LED is On when the module is receiving 5VDC power from the attached power supply. It is Off when there is no power supply attached or when the power supply itself is not receiving power.

The SCAN LED lights green when the CPU/NIU is actively scanning I/O in expansion racks. It lights amber when the CPU/NIU is not actively scanning I/O in expansion racks.

The EXP RX LED indicates the status of the expansion bus. This LED is either blinking or On when the Expansion Receiver is communicating with the Expansion Transmitter. It is Off when not communicating.

## Expansion Rack Selection Switch

The Rack Selection Switch is used to specify which expansion rack the ERM is in.

IC200ERM001
Expansion Receiver Module, Isolated

## VersaMax Expansion Modules Standard RS-485 Differential Expansion Interface

The Expansion Receiver Module connects to an Expansion Transmitter Module in a VersaMax PLC or VersaMax NIU I/O Station, or to an Expansion Receiver in a previous rack, as shown below. Modules are connected using expansion cable IC200CBL6xx (xx represents the length in meters). Up to seven expansion racks can be used in a system. With the isolated Expansion Receiver Module, the total overall length of the expansion cable can be up to 750 meters.

## Cable Length and Data Rate

By default, the module is set up to operate with the maximum length expansion cable at the default data rate of $250 \mathrm{Kbits} /$ second.

If the total length of the expansion cable is less than 250 meters and there are no nonisolated Expansion Receivers (IC200ERM002) in the expansion system, the VersaMax PLC programmer allows the data rate to be configured to $1 \mathrm{Mbit} /$ second. In an NIU I/O Station, the data rate cannot be changed from the default 250 Kbits .

## Terminator Plug

The terminator plug supplied with the Expansion Transmitter Module must be installed in the lower connector of the last Expansion Receiver in the chain as shown above.

## IC200ERM001

## Expansion Receiver Module, Isolated

Module Specifications

| Module Characteristics |  |
| :---: | :---: |
| Module ID |  |
| LED indicators | PWR LED indicates 5VDC power status EXP RX LED indicates status of the expansion bus SCAN indicates whether CPU/NIU is scanning I/O in expansion racks |
| Backplane current consumption | 5 V output: 430 mA maximum. 3.3 V output: 20 mA |
| Cable Specifications |  |
| Maximum cable length <br> Effective data rate <br> Electrical Isolation | 250 meters (if configured for higher data rate) <br> 750 meters (default distance) <br> 1 Mbits/sec (configurable for cable less than 250 meters) 250 Kbits/sec (default data rate) <br> 500 VDC isolated differential communications |

## Compatibility

All I/O and communications modules can be used in expansion racks. Some analog modules require specific module revisions as listed below. The date code is a 3-digit number on the outside of the module and on the shipping box.

| Module | Module <br> Revision | Module Date Code Range |
| :---: | :---: | :---: |
| IC200ALG320 | B or later | Any |
| IC200ALG321 | B or later | Any |
| IC200ALG322 | B or later | Any |
| IC200ALG430 | C or later | Any |
| IC200ALG431 | C or later | Any |
| IC200ALG432 | B or later | Any |
| IC200ALG230 | A or later | CPU or NIU Revision 1.5: Date code must begin with a number <br> other than 9 and must be 011 or greater. |
|  | Any | CPU or NIU Revision 2.0 or later: Any date code. |
| IC200ALG260 | A or later | CPU or NIU Revision 1.5: Date code must begin with a number <br> other than 9 and must be 011 or greater. |
|  | Any | CPU or NIU Revision 2.0 or later: Any date code. |

## IC200ERM002 <br> Expansion Receiver Module, Non-isolated

The non-isolated Expansion Receiver Module (IC200ERM002) interfaces an expansion "rack" to a VersaMax PLC or VersaMax NIU I/O Station system. The expansion rack can to include up to eight VersaMax I/O and special-purpose modules. A VersaMax power supply installed on the Expansion Receiver Module provides operating power for the modules in the expansion rack. This module may be used without an Expansion Transmitter Module (IC200ETM001) in the PLC or I/O Station if there is only one expansion rack in the system or if the cable length is one meter or less. An Expansion Transmitter Module is required if there are multiple expansion racks or for a longer cable. Maximum cable length for this non-isolated module is 15 meters.

- High speed bus expansion interface
- Supports Hold Last State
- System fault isolation
- Three LEDs indicate module power status and expansion port status
- No DIP switches to set, easy software configuration into PLC system
- Power supply mounts directly to module
- Differential or single-ended operation

The Expansion Receiver Module supports hold last state operation of the output modules in the event of loss of communications with the CPU/NIU. It also permits isolation and repair of a faulty module within a rack.

## IC200ERM002 <br> Expansion Receiver Module, Non-isolated

## Connectors

The Expansion Receiver has two 26-pin female D-shell expansion ports. The upper port receives the cable from an Expansion Transmitter or upstream Expansion Receiver Module. The lower port is used to connect the expansion cable to the next expansion rack or to attach the terminator plug at the last rack.

## LED Indicators

Three LEDs show the status of module power, the expansion port, and the I/O modules.

The PWR LED is On when the module is receiving 5VDC power from the attached power supply. It is Off when there is no power supply attached or when the power supply itself is not receiving power.

The SCAN LED lights green when the CPU/NIU is actively scanning I/O in expansion racks. It lights amber when the CPU/NIU is not actively scanning I/O in expansion racks.

The EXP RX LED indicates the status of the expansion bus. This LED is either blinking or On when the Expansion Receiver is communicating with the Expansion Transmitter or with other ERMs. It is Off when not communicating.

## Expansion Rack Selection Switch

The Rack Selection Switch is used to specify which expansion rack the ERM is in.

IC200ERM002
Expansion Receiver Module, Non-isolated

## VersaMax Expansion Modules Standard RS-485 Differential Expansion Interface

The Expansion Receiver Module connects to an Expansion Transmitter Module in a VersaMax PLC or VersaMax NIU I/O Station, or to an Expansion Receiver in a previous rack, as shown below. Modules are connected using expansion cable IC200CBL6xx (xx represents the length in meters). Up to seven expansion racks can be included in the system. With the non-isolated Expansion Receiver Module, the total overall length of the expansion cable can be up to 15 meters.

## Terminator Plug

The terminator plug supplied with the Expansion Transmitter Module is installed in the last Expansion Receiver in a chain as shown above. If the Expansion Receiver is at the end of the chain, the terminator plug is installed in the lower expansion port.

No terminator plug is required in the single-ended configuration described on the next page.

## IC200ERM002

Expansion Receiver Module, Non-isolated

## Two-Rack Local System

Expansion Receiver IC200ERM002 can also be used to connect a VersaMax PLC main rack or VersaMax NIU I/O Station to just one expansion rack without having an Expansion Transmitter Module in the main rack.

This "single-ended" configuration has a maximum cable length of 1 meter. No terminator plug is required in the expansion rack.

VersaMax PLC or NIU I/O Station Main Rack

Module Specifications

## Compatibility

All I/O and communications modules can be used in expansion racks. Some analog modules require specific module revisions as listed below. The date code is a 3-digit number on the outside of the module and on the shipping box.

| Module | Module <br> Revision | Module Date Code Range |
| :---: | :---: | :---: |
| IC200ALG320 | B or later | Any |
| IC200ALG321 | B or later | Any |
| IC200ALG322 | B or later | Any |
| IC200ALG430 | C or later | Any |
| IC200ALG431 | C or later | Any |

|  | CPU or NIU Revision 2.0 or later: Any date code. |  |
| IC200ALG260 | A or later | CPU or NIU Revision 1.5: Date code must begin with a <br> number other than 9 and must be 011 or greater. |
|  | Any | CPU or NIU Revision 2.0 or later: Any date code. |

## Chapter 7

Discrete Input Modules

This chapter describes VersaMax discrete input modules:

- IC200MDL140 Input Module, 120VAC 8 Points
- IC200MDL141 Input Module, 240VAC 8 Points
- IC200MDL143 Input Module, 120VAC Isolated 8 Points
- IC200MDL144 Input Module, 240VAC Isolated 4 Points
- IC200MDL240 Input Module, 120VAC 16 Points
- IC200MDL241 Input Module, 240VAC16 Points
- IC200MDL243 Input Module, 120VAC Isolated 16 Points
- IC200MDL244 Input Module, 240VAC Isolated 8 Points
- IC200MDL631 Input Module, 125VDC Pos/Neg Logic Isolated 8 Points
- IC200MDL632 Input Module, 125VDC Pos/Neg Logic Isolated 16 Points
- IC200MDL635 Input Module, 48VDC Pos/Neg Logic Grouped 16 Points
- IC200MDL636 Input Module, 48VDC Pos/Neg Logic Grouped 32 Points
- IC200MDL640 Input Module, 24VDC Pos/Neg Logic 16 Points
- IC200MDL643 Input Module, 5/12VDC Pos/Neg Logic Grouped 16 Points
- IC200MDL644 Input Module, 5/12VDC Pos/Neg Logic Grouped 32 Point
- IC200MDL650 Input Module, 24VDC Pos/Neg Logic 32 Points

## IC200MDL140 <br> Input Module, 120VAC 8 Points

Discrete Input Module IC200MDL140 provides one group of 8 discrete inputs. Inputs are positive logic or sourcing-type inputs; they receive current from AC input devices and return the current on the common. Input devices are connected between the input terminals and common terminals.

Power for module operation comes from the backplane.
Intelligent processing for the module is performed by the CPU or NIU. The module provides 8 bits of discrete input data.

## LED Indicators

Individual green LEDs indicate the on/off state of each input point.
The green OK LED is on when backplane power is present to the module.

Module Specifications

| Module Characteristics |  |
| :--- | :--- |
| Points | One group of 8 inputs |
| Module ID | FFFF8804 |
| Isolation: <br> User input to logic (optical) <br> and frame ground <br> Group to group <br> Point to point | Not applicable <br> None |
| LED indicators | One LED per point shows individual point ON/OFF status <br> OK LED indicates backplane power is present |
| Backplane current <br> consumption | 5 output: 55mA maximum |

## IC200MDL243

Input Module, 120VAC Isolated 16 Points
Thermal Derating
The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail.

|  | No thermal derating for these installations. |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No derating at 120VAC. Deratings at 132VAC are shown below. <br> Ambient Temperature |  |  |  |  |  |  |  |  |  |  |  |  |

Discrete Input Module IC200MDL244 provides 8 isolated discrete inputs. Inputs are positive logic or sourcing-type inputs; they receive current from AC input devices and return the current on the common. Input devices are connected between the input terminals and common terminals.

Power for module operation comes from the backplane.
Intelligent processing for the module is performed by the CPU or NIU. The module provides 8 bits of discrete input data (4 bits per card).

## LED Indicators

Individual green LEDs indicate the on/off state of each input point.
The green OK LED is on when backplane power is present to the module.

| Wiring Connections <br> for Carriers with <br> Three Rows of <br> Terminals <br> IC200CHS001, 022, 025 |  |  |

Module IC200MDL244 should be used with a compact terminal-style carrier (IC200CHS022 or 025) or with a terminal-style carrier (IC200CHS001, 002, 005 suffix "B" or higher). This module cannot be used with a Connector-Style Carrier (IC200CHS003) due to its high isolation requirement.

## IC200MDL631 <br> Input Module, 125VDC Pos/Neg Logic Isolated 8 Points

Discrete input module IC200MDL631 provides 8 discrete isolated inputs. Inputs can be either positive logic inputs that receive current from input devices and return the current on the return, or negative-logic inputs that receive current from the return and return current to the input device. Input devices are connected between the input terminals and return terminals.

Power for module operation comes from the backplane.
Intelligent processing for this module is performed by the CPU or NIU. The module provides 8 bits of discrete input data.

## LED Indicators

Individual green LEDs indicate the on/off state of each input point. Backplane power must be present for LEDs to provide status of inputs.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of 0 ms , 1.0 ms , or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. The default is 1.0 ms filter time (total response time is 1.5 ms ).

## IC200MDL632

Input Module, 125VDC Pos/Neg Logic Isolated 16 Points

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail.

There is no derating at 125 VDC . Deratings at 150 VDC are shown below.

## IC200MDL635 <br> Input Module, 48VDC Pos/Neg Logic Grouped 16 Points

Discrete input module IC200MDL635 provides two groups of 8 discrete inputs. Inputs in each group can be either positive logic inputs that receive current from input devices and return the current on the common, or negative-logic inputs that receive current from the common and return current to the input device. Input devices are connected between the input terminals and common terminals.

Power for module operation comes from the backplane.
Intelligent processing for this module is performed by the CPU or NIU. The module provides 16 bits of discrete input data.

## LED Indicators

Individual green LEDs indicate the on/off state of each input point. Backplane power must be present for LEDs to provide status of inputs.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of 0 ms , 1.0 ms , or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. ## IC200MDL643 <br> Input Module, 5/12VDC Pos/Neg Logic Grouped 16 Points

Discrete input module IC200MDL643 provides two groups of 8 discrete inputs. Inputs in each group can be either positive logic inputs that receive current from input devices and return the current on the common, or negative-logic inputs that receive current from the common and return current to the input device. Input devices are connected between the input terminals and common terminals. The module supports positive and negative logic inputs. For the inputs to be compatible with TTL devices, the negative logic configuration should be used.

Power for module operation comes from the backplane.
Intelligent processing for this module is performed by the CPU or NIU. The module provides 16 bits of discrete input data.

## LED Indicators

Individual green LEDs indicate the on/off state of each input point. Backplane power must be present for LEDs to provide status of inputs.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.25 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of 0 ms , 1.0 ms , or 7.0 ms are selectable via software configuration, for total response times of $0.25 \mathrm{~ms}, 1.25 \mathrm{~ms}$, and 7.25 ms respectively. The default is 1.0 ms filter time (total response time is 1.25 ms ).

- IC200MDL744
- IC200MDL750 Output Module, 12/24VDC Positive Logic 0.5 Amp, 32 Points
- IC200MDL930 Output Module, Relay 2.0 Amp Isolated Form A 8 Points
- IC200MDL940 Output Module, Relay 2.0 Amp, Isolated Form A 16 Points

## IC200MDL329 <br> Output Module, 120VAC 0.5 Amp, Isolated 8 Points

Discrete output module IC200MDL329 provides 8 isolated outputs.

An external 120 VAC power supply must be provided to switch power to the loads.
Intelligent processing for this module is performed by the CPU or NIU. The module receives 8 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points. The output LEDs are logic-driven and independent of the load conditions.

The green OK LED is on when backplane power is present to the module.

Module Specifications

## —IC200MDL331 <br> Output Module, 120VAC 2.0 Amp, Isolated 8 Points

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the output current, and the orientation of the module and DIN rail. The charts below show thermal deratings for the module at 120 VAC with the indicated output current per point.

## IC200MDL730 <br> Output Module, 24VDC Positive Logic 2.0 Amps, w/ESCP 8 Points

Discrete output module IC200MDL730 provides one group of 8 discrete outputs. Each point has electronic overcurrent protection and short circuit protection, and generates a fault if either condition exists. The outputs are positive or sourcing type outputs. They switch the loads to the positive side of the DC supply and thus supply current to the loads.

An external DC power supply must be provided to switch power to the loads.
At powerup, the backplane power supply must be on and stable for 1 second before field power is applied to the module. Failure to follow this sequence could result in false output point faults. These faults can be cleared as described below.

Intelligent processing for this module is performed by the CPU or NIU. The module receives 8 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points. The LEDs are dependent on field power, but independent of load conditions.
Individual amber LEDs indicate overload or short circuit conditions on each output point.

The green FLD PWR LED is on when field power is applied to the module.
The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module provides point-level diagnostics (fault detection) of overload and short circuit conditions. Each point fault is identified both at the CPU/NIU and by means of an amber LED. Once an overload/short circuit condition is reported, the fault is latched. It remains latched until a Clear Fault is issued or user power to the module is cycled.

## Module Specifications

| Protection (each output) |  |

## External Power Supply Requirements

The external power supply used to power the loads must provide sufficient field power for the module during short circuit events. When a load is shorted, an inadequate external power supply may allow field power to drop below the specified operating range, causing mis-operation of the module. The external power supply must be capable of providing short circuit energy without degradation of output voltage levels. The amount of energy required depends on the number of simultaneously-shorted points that might occur. Refer to power supply short circuit operation specifications when selecting the power supply to be used with the loads.
Local energy storage (either batteries or capacitors) can be used to compensate for insufficient power supply characteristics. Additional best practices including minimizing wiring resistance from the external power supply to the module must be observed.

## IC200MDL750 <br> Output Module, 12/24VDC Positive Logic 0.5 Amp, 32 Points

Discrete output module IC200MDL750 provides two groups of 16 discrete outputs.
The outputs are positive or sourcing type outputs. They switch the loads to the positive side of the DC supply and thus supply current to the loads.

Note: 12V output functionality requires module version IC200MDL750B or higher.
An external DC power supply must be provided to switch power to the loads.
Intelligent processing for this module is performed by the CPU or NIU. The module receives 32 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points. Operation of these LEDs is dependent on field power but independent of load conditions.

The green FLD PWR LED is on when field power is applied to the module.
The green OK LED is on when backplane power is present to the module.

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. The charts below show example thermal deratings for the module at 24VDC and 30VDC with the maximum output current per point.

## IC200MDL930 <br> Output Module, Relay 2.0 Amp Isolated Form A 8 Points

Relay output module IC200MDL930 provides 8 individually-isolated Form A relay outputs. The contact is closed when the host CPU is active and the corresponding output logic bit is " 1 ".

Power for module operation comes from the backplane. Loads must be powered by an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module receives 8 bits of discrete output data.

## LED Indicators

Individual green logic-side LEDs indicate the On/Off status of each output point. Output LEDs are logic-driven and independent of the load conditions.

The green OK LED is ON when backplane power is present to the module.

## IC200MDD840

## Mixed Module, 24VDC Positive Logic Input 20 Points / <br> Output Relay 2.0 Amp 12 Points

Discrete input/output module IC200MDD840 provides 20 discrete inputs and 12 relay outputs. The inputs form two groups of 10 points. Inputs are positive logic or sourcing-type inputs; they receive current from devices and return the current on the common. The relay outputs form two groups of 6 points. Each output group can drive a maximum of 8 Amps.

Power for module operation comes from the backplane. Output loads must be powered by an external source.

Intelligent processing for the module is performed by the CPU or NIU. The module provides 20 bits of discrete input data and receives 12 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points and input points.
The output LEDs are logic-driven and independent of the load conditions.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of $0 \mathrm{~ms}, 1.0 \mathrm{~ms}$, or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. The default is 1.0 ms filter time (total response time is 1.5 ms ).

## Backplane Power Drain per Point

The module's backplane 5 volt power requirement increases as the number of points that are simultaneously on increases. The chart below shows the relationship between the number of points on and the maximum current required.
$\mathrm{mA}=40+(28 \times$ number of output points on $)$
Maximum Current Drawn from Backplane (mA)

IC200MDD842
Mixed Module, Output 24VDC Pos. Logic 0.5A Grouped w/ESCP 16 Points
/ Input 24VDC Pos/Neg Logic Grouped 16 Points
Discrete input/output module IC200MDD842 provides one group of 16 discrete outputs w/ESCP and two groups of 8 discrete inputs. The outputs are positive or sourcing type outputs. Each point has electronic over-current protection and short circuit protection, and generates a fault if either condition exists. They switch the loads to the positive side of the DC supply and thus supply current to the loads. Inputs in each group can be either positive logic inputs that receive current from input devices and return the current on the common, or negative-logic inputs that receive current from the common and return current to the input device. Input devices are connected between the input terminals and common terminals.

Note: Negative-logic functionality requires module version IC200MDD842B or higher.
An external DC power supply must be provided to switch power to the loads. Intelligent processing for this module is performed by the CPU or NIU. The module provides 16 bits of discrete input data and receives 16 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points and input points. Operation of the output LEDs is dependent on field power, but independent of load conditions. Individual amber LEDs indicate overload conditions on each output point. The green FLD PWR LED is on when field power is applied to the module. The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms . For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of $0 \mathrm{~ms}, 1.0 \mathrm{~ms}$, or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. The default is 1.0 ms filter time (total response time is 1.5 ms ).

## Diagnostics

The module reports the presence of any overloaded points to the system on a per-module basis. Amber LEDs indicate the overload conditions on a per-point basis. Once the overload condition is removed, normal operation is resumed.

## External Power Supply Requirements

The external power supply used to power the loads must provide sufficient field power for the module during short circuit events. When a load is shorted, an inadequate external power supply may allow field power to drop below the specified operating range, causing misoperation of the module. The external power supply must be capable of providing short circuit energy without degradation of output voltage levels. The amount of energy required depends on the number of simultaneously-shorted points that might occur. Refer to power supply short circuit operation specifications when selecting the power supply to be used with the loads.

Local energy storage (either batteries or capacitors) can be used to compensate for insufficient power supply characteristics. Additional best practices including minimizing wiring resistance from the external power supply to the module must be observed.

## Mixed Module, Output 24VDC Pos. Logic 0.5A Grouped w/ESCP 16 Points /Input 24VDC Pos/Neg Logic Grouped 16 Points

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. The charts that follow show thermal deratings for this module at 24 V and 30 V . The shaded bands are temperature ranges that represent allowable combinations of inputs points for the indicated number of outputs points. All combinations of points are permissible at lower temperatures. The narrow white line within each range shows maximum temperature when the number of output points equals the number of input points that are on at the same time.

## IC200MDD843 <br> Mixed Module, 24VDC Positive Logic Input Grouped 10 Points / <br> Output Relay 2.0A per Point Grouped 6 Points

Discrete input/output module IC200MDD843 provides 10 discrete inputs and 6 relay outputs. The inputs form one group of 10 points. Inputs are positive logic or sourcing-type inputs; they receive current from input devices and return the current on the common. The relay outputs form one group of 6 points. The output group can drive a maximum of 8 Amps.

Power for module operation comes from the backplane. Loads must be powered by an external source.

Intelligent processing for the module is performed by the CPU or NIU. The module provides 10 bits of discrete input data and receives 6 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points and input points.
The output LEDs are logic-driven and independent of the load conditions.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of $0 \mathrm{~ms}, 1.0 \mathrm{~ms}$, or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. The default is 1.0 ms filter time total (response time is 1.5 ms ).

Maximum Current Drawn from Backplane (mA)

## IC200MDD844

Mixed Module, Output 12/24VDC Pos. Logic 0.5A 16 Points
/ Input 24 VDC Pos/Neg Logic Grouped 16 Points

Discrete input/output module IC200MDD844 provides one group of 16 discrete outputs and two groups of 8 discrete inputs. The outputs are positive or sourcing type outputs. They switch the loads to the positive side of the DC supply and thus supply current to the loads. Inputs are positive logic; they receive current from input devices and return the current on the common. Input devices are connected between the input terminals and common terminals.

Note: Negative logic input functionality and 12 V output functionality require module version IC200MDD844C or higher.
An external DC power supply must be provided to switch power to the loads.
Intelligent processing for this module is performed by the CPU or NIU. The module provides 16 bits of discrete input data and receives 16 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the on/off state of the output points and input points. Operation of the output LEDs is dependent on field power, but independent of load conditions.

The green FLD PWR LED is on when field power is applied to the module.
The green OK LED is on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.5 ms .
For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of $0 \mathrm{~ms}, 1.0 \mathrm{~ms}$, or 7.0 ms are selectable via software configuration, for total response times of $0.5 \mathrm{~ms}, 1.5 \mathrm{~ms}$, and 7.5 ms respectively. The default is 1.0 ms filter time (total response time is 1.5 ms ).

$m A=76+(28 x$ number of output points on $)$
Maximum Current Drawn from Backplane (mA)

## IC200MDD847 Mixed Module, Output Relay 2.0A per Pt Isolated 8 Points / Input 240VAC Grouped 8 Points

Discrete input/output module IC200MDD847 provides 8 discrete inputs and 8 relay outputs. Inputs are positive logic or sourcing-type inputs; they receive current from devices and return the current on the common. Outputs are individually-isolated relays which can drive a maximum of 2 A per output. These are Form A relay outputs where the contact is closed when the host CPU is active and the corresponding output logic bit is " 1 ".

Power for module operation comes from the backplane. Output loads must be powered by an external source.

Intelligent processing for the module is performed by the CPU or NIU. The module provides 8 bits of discrete input data and receives 8 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the On/Off states of the output points and input points. Operation of the output LEDs is logic driven and independent of the load conditions.

The green OK LEDs are on when backplane power is present to the module.

## IC200MDD848

## Mixed Module, Output 120VAC 0.5A per Pt Isolated 8 Points / Input 120VAC Grouped 8 Points

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. The charts that follow show thermal deratings for this module at 120 VAC and 132 VAC . The shaded bands are temperature ranges that represent allowable combinations of inputs points for the indicated number of outputs points. All combinations of points are permissible at lower temperatures. The narrow white line within each range shows maximum temperature when the number of output points equals the number of input points that are on at the same time.

$$

## Maximum Current Drawn from Backplane (mA)

## IC200MDD851 <br> Mixed Module, Output 12/24VDC Positive Logic Grouped <br> 16 Points / Input 5/12VDC Pos/Neg Logic Grouped 16 Points

Discrete input/output module IC200MDD851 provides two groups of 8 discrete inputs and one group of 16 discrete outputs. Inputs in each group can be either positive logic inputs that receive current from input devices and return the current on the common, or negativelogic inputs that receive current from the common and return current to the input device. Input devices are connected between the input terminals and common terminals. For the inputs to be compatible with TTL devices, the negative logic configuration should be used. The outputs are positive or sourcing type outputs. They switch the loads to the positive side of the DC supply and thus supply current to the loads.

Power for module operation comes from the backplane. Output loads must be powered by an external source.
Intelligent processing for the module is performed by the CPU or NIU. The module provides 4 bits of discrete input data and receives 8 bits of discrete output data.

## LED Indicators

Individual green LEDs indicate the On/Off states of the output points and input points. Backplane power must be present for LEDs to provide status of inputs. The output LEDs are dependent on field power, but independent of load conditions.

The green FLD PWR LED is on when field power is applied to the module.
The green OK LEDs are on when backplane power is present to the module.

## Configuration Parameters

The module's basic input on/off response time is 0.25 ms . For some applications, it may be preferable to add additional filtering to compensate for conditions such as noise spikes or switch bounce. Input filter times of $0 \mathrm{~ms}, 1.0 \mathrm{~ms}$, or 7.0 ms are selectable via software configuration, for total response times of $0.25 \mathrm{~ms}, 1.25 \mathrm{~ms}$, and 7.25 ms respectively. The default is 1.0 ms filter time (total response time is 1.25 ms ).

## Wiring for TTL Inputs

To be compatible with TTL outputs, the negative logic configuration should be used as shown below.

## IC200MDD851

## Mixed Module, Output 12/24VDC Positive Logic Grouped 16 Points / Input 5/12VDC Pos/Neg Logic Grouped 16 Points

## Thermal Derating

The number of points that can be on at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. There is no derating for 12VDC inputs, The charts that follow show thermal deratings for this module at 24 VDC . All combinations of points are permissible at lower temperatures.

Analog Input Module, 15 Bit Voltage 15 Channels
Analog Input Module, 15 Bit Current 15 Channels

## IC200ALG230

Analog Input Module, 12 Bit Voltage/Current 4 Channels

Analog input module IC200ALG230 provides an interface to 4 voltage inputs or 4 current inputs. The inputs are single-ended, with all inputs sharing a common return.

The module receives power from the backplane power supply. No external power source is required for module operation. Power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module provides 4 words of analog input data.

## LED Indicators

The green INT PWR LED indicates the presence of internally-generated field power for the analog field-side circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of Internal Power fault for field-side circuits.

## Configuration Parameters

Two jumpers on the carrier terminals can be used to configure voltage or current mode and unipolar or bipolar operation in voltage mode. One jumper selects either voltage or current operating mode. With this jumper connected, the module accepts current inputs in the 4 mA to 20 mA range. With no jumper installed the module accepts -10 VDC to +10 VDC inputs.

In voltage mode, a different jumper on the carrier can be used to select the 0 to 10 VDC range.

## Module Specifications

| Module Characteristics |  |
| :---: | :---: |
| Channels | 4 single ended, one group |

## Jumper Selections

Jumpers on JMP 1 and JMP 2 select voltage or current operation and voltage range. In current mode, JMP2 is ignored.

| Jumper | Range |
| :--- | :--- |
| None | $+/-10 \mathrm{~V}$ |
| 1 | $4-20 \mathrm{~mA}$ |
| 2 | $0-10 \mathrm{~V}$ |
| $1 \& 2$ | Not recommended |

## Wiring Examples

An external source is needed to power input transceivers.

## IC200ALG230

Analog Input Module, 12 Bit Voltage/Current 4 Channels

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## Scaling

The graphs below show the relationship between the input voltage or current measured at the field terminals and the data that is output by the module.

## Count and Input Current

The following equation can be used to calculate counts values:

$$
\text { Counts }=(\text { Current in mA }-4 m A) \times(32768 / 16.38 m A)
$$

For a change in the reported count value to be seen, input current must be increased by at least $4 \mu \mathrm{~A}$. If the module receives an increase less than $4 \mu \mathrm{~A}$, the previous count value is still reported. For example:

| Current | Count |
| :---: | :---: |
| 12.190 mA | 16384 |
| 12.192 mA | 16384 |
| 12.194 mA | 16392 |

## IC200ALG230

Analog Input Module, 12 Bit Voltage/Current 4 Channels

## Count and Input Voltage

The following equations can be used to calculate counts values:

$$
\begin{array}{ll}
\text { Bipolar voltage: } & \text { Counts }=( \pm \text { Voltage In }) \times(3200) \\
\text { Unipolar voltage: } & \text { Counts }=(+ \text { Voltage In }) \times(3200)
\end{array}
$$

For a change in the reported count value to be seen, input current must be increased by at least 2.5 mV . If the module receives an increase less than 2.5 mV , the previous count value is still reported. For example:

| Voltage | Count |
| :---: | :---: |
| 5.1200 V | 16384 |
| 5.1220 V | 16384 |
| 5.1225 V | 16392 |

## Input Defaults

The module's analog input (\%AI) data can be configured to either hold last state or to go to a configured value if an error causes the inputs to default.

If the module is autoconfigured, the input default is 0 .

## Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

Analog input module IC200ALG240 provides eight analog inputs. Features include:

- Eight isolated $4-20 \mathrm{~mA}$ current input channels
- Sixteen-bit converter resolution
- Open wire detection
- High-accuracy factory calibration

The following additional features are software-configurable:

- Per-channel selection of $4-20 \mathrm{~mA}$ current or $+/-10 \mathrm{~V}$ voltage inputs
- Selectable input filter to reject normal mode AC pickup noise
- Selection of default/hold last state operation
- Per-channel selection of default values
- Per-channel selection of under-range and over-range diagnostics levels
- Per-channel selection of alarm levels
- Per-channel scaling
- Field re-calibration on command from VersaMax PLC CPU

In current mode, a separate power supply may be required for isolated inputs.
The module provides 8 words of analog input data to the system CPU or NIU.

## LED Indicators

The green FLD PWR LED indicates the presence of both backplane power and field power for the analog field-side circuits. The absence of either backplane or field power turns off the FLD PWR LED.

The OK LED indicates module status:

- On green indicates normal operation
- Flashing green indicates boot mode or update
- Flashing amber indicates self-diagnostic error
- Off indicates no 3.3 V backplane power

## IC200ALG240

Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

## Module Specifications

| Module Characteristics |  |
| :---: | :---: |

| Analog Resolution (1 LSB) | Current mode: 381 nA nominal Voltage mode: $381 \mu \mathrm{~V}$ nominal |
| Channel data Update rate per module | Approximately 20 mS max. @ 50 Hz filter frequency Approximately 16.7 mS max. @ 60 Hz filter frequency |
| Channel-to-channel crosstalk rejection | 70dB minimum |
| Input default | 0 (default) <br> Hold Last State (configurable) |
| Field input DC resistance | Current mode: 150 Ohms Voltage mode:760 KOhms |
| Field input filter | Type: Digital w/programmable notches at 50 or 60 Hz 3 dB Corner Frequency: $10 \mathrm{~Hz} \pm 25 \%$ |
| Normal mode (power line frequency) rejection | 35 dB minimum |
| Field Input Ranges | Current mode: Approximately 0 mA to +25 mA Voltage mode: Approximately -12.5 V to +12.5 V |
| Maximum field input (without damage) | Current mode: $\pm 35 \mathrm{~mA}$ continuous Voltage mode: $\pm 17.5 \mathrm{~V}$ continuous |

## IC200ALG240 <br> Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

## Field Wiring

| Number | Connection | Number | Connection |
| :---: | :---: | :---: | :---: |
| A1 | Shield Termination Point | B1 | Shield Termination Point |
| A2 | VIN1- | B2 | VIN5- |
| A3 | IIN1- | B3 | IIN5- |
| A4 | VINIIN1+ | B4 | VINIIN5+ |
| A5 | Shield Termination Point | B5 | Shield Termination Point |
| A6 | VIN2- | B6 | VIN6- |
| A7 | IIN2- | B7 | IIN6- |
| A8 | VINIIN2+ | B8 | VINIIN6+ |
| A9 | Shield Termination Point | B9 | Shield Termination Point |
| A10 | VIN3- | B10 | VIN7- |
| A11 | IIN3- | B11 | IIN7- |
| A12 | VINIIN3+ | B12 | VINIIN7+ |
| A13 | Shield Termination Point | B13 | Shield Termination Point |
| A14 | VIN4- | B14 | VIN8- |
| A15 | IIN4- | B15 | IIN8- |
| A16 | VINIIN4+ | B16 | VINIIN8+ |
| A17 | DC- | B17 | No connection |
| A18 | DC+ | B18 | No connection |

A 24 volt power supply must be connected to A17 and A18 to operate the module. The power wiring does not require shielding. Current inputs are applied with positive current flow into VININn+ and out of IINn-. Both negative terminals IINn- and VINn- of the channel should be connected together for best accuracy on current ranges. Voltage inputs are applied between VININn+ and VINn- with positive to VININn+.

## IC200ALG240

Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

## Cable Shield Connections

If possible, analog input channel connections should be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module.

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHSO22 or 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## Operation

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above. The module is configured at startup. If the module is autoconfigured, it will operate with its default features. After configuration, the module begins receiving signals from the input devices connected to it.

## Calibration

The module is calibrated at the factory. For most applications, no further calibration is required. It is possible to perform recalibration in either of the following ways:

- By changing a module's scaling so its scaled data agrees with metered values.
- By sending the module a recalibration message as described in the PLC User's Manual. Note that the module must be power cycled when reverting from field calibration back to factory calibration.

## Diagnostics

By default, the module is configured for fault reporting. The module reports faults as soon as they are detected. Once a fault has been reported, the same fault is not reported again until the fault has been cleared. Fault reporting can be disabled via configuration. If disabled, faults are not reported. The module can detect and report the following faults:

## Over-Range

The module reports an Over Range fault if an input value is greater than approximately +12.5 volts or 25 mA .

## Under-Range

The module reports an Under Range fault if an input value is approximately 0 mA on an current channel or -12.5 volts on a voltage channel.

## Open Wire

The module reports an Open Wire fault on current inputs if the configuration of the low end of the range is greater than or equal to approximately 2.0 mA , but the input is not detecting current.

## Loss of Field Power Supply

The module reports a Loss of Field Power fault if field power is not present (also indicated by the FLD PWR LED). Inputs default as specified by the configuration.

## High Limit

The module reports a High Alarm fault if an input value is greater than or equal to the value specified by the "Alarm High" configuration parameter.

## Low Limit

The module reports a Low Alarm fault if an input value is less than or equal to the value specified by the "Alarm Low" configuration parameter.

## Non-volatile Memory Fault

The module reports this fault only during field recalibration if a non-volatile memory fault is detected.

## IC200ALG240

Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

## Configurable Parameters

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above.

| Module Parameter | Description | Default | Choices |
| :---: | :---: | :---: | :---: |
| Analog Input Data Reference | Starting offset for the module's analog input data. |  | user selectable |
| Analog Input Data Length | Word length of the module's analog input data. | 8 | 0-8 |
| Line Frequency | Specifies the line filter frequency. | 60 Hz | $50 \mathrm{~Hz}, 60 \mathrm{~Hz}$ |
| Report Faults | Enables or disables Fault Reporting for the entire Module. | Enabled | Enabled, Disabled |
| \%AI Default /Hold Last State | Specifies whether the module will go to the specified channel defaults (see below) or hold their last states if power or communications are lost. | Default | Default/Hold |
| Current <br> /Voltage | Specifies whether the channel will be a voltage or current input. <br> If the Channel type is Current, the range is 4 to 20 mA . If Channel type is Voltage, the range is -10 to +10 V . | I (Current) | I (Current), <br> V (Voltage) |
| Channel Active | Specifies if the channel should input data received from the CPU or NIU. If a channel is "inactive" space is still allocated for it. | Active | Inactive (off), Active (on) |
| Span Low | Actual current (in microAmps) or voltage (in milliVolts) to be scaled from low engineering units value. | 4,000 $\mu \mathrm{A}$ | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Span High | Actual current in microAmps or voltage in millivolts to be scaled from the high engineering units value. | 20,000 $\mu \mathrm{A}$ | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Engineering Low | The engineering units value that is considered equivalent to the low span (actual) value. | 4000 | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \\ \hline \end{gathered}$ |
| $\underset{\text { High }}{\text { Engineering }}$ | The engineering units value that is considered equivalent to the high span (actual) value. | 20000 | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Alarm Low | The low alarm limit for the channel, in engineering units. | 4000 | -32768 to +32767 |
| Alarm High | The high alarm limit for the channel, in engineering units. | 20000 | -32768 to +32767 |
| Default | The value to be input when the module is in a default condition. | 0 | -32768 to +32767 |

## Configuring Scaling

The module converts electrical signals (either current or voltage, as configured) into digital output values for the CPU or NIU. By default, the module converts this data from 1 millivolt or 1 microamp "internal units" for convenience in scaling and comparing to actual meter measurements.

The module's default scaling can be changed to tailor the data for a specific application. Typically, engineering units represent millivolts or microamps. But they may also represent physical units such as degrees or centimeters per second. When reconfiguring scaling, it is important to be sure that the chosen Engineering Units values would not result in Overrange or Underrange output levels.
The scaling for each channel can be configured independently. Scaling is configured by selecting corresponding low and high engineering units values and low and high internal values (counts) for two points.

During operation, the module will use the straight line defined by these two pairs of configured scaling values to convert internal values to current or voltage signal levels that represent appropriate engineering units.

## Scaling Values for $1 m V$ or $1 \mu A$ Engineering Units

For many applications, the engineering units are either millivolts or microAmps. These units are easy to scale. Simply use the table below to find scaling values that are appropriate for the channel's configured range.

| Examples | Input <br> Range | Enter this engineering <br> units value |  | Span Units <br> (microAmps) |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 4 mA to 20 mA | 4 mA | Low | $+4,000$ | Low | $+4,000$ |
|  | 20 mA | High | $+20,000$ | High | $+20,000$ |
| -10 volts to +10 volts | 0 volts | Low | 0 |  | Low |
|  | +10 volts | High | $+10,000$ | High | $+20,000$ |
| 0 mA to 20 mA | 0 mA | Low | 0 |  | Low |
|  | 20 mA | High | $+20,000$ | High | $+20,000$ |
| -10 volts to +10 volts | -5 volts | Low | $-5,000$ | Low | $-5,000$ |
|  | +10 volts | High | $+10,000$ | High | $+10,000$ |

## IC200ALG240

Analog Input Module, 16 Bit Voltage/Current, 1500VAC Isolation, 8 Channels

## Scaling Example

A channel is configured in the 0 to 10 volts DC range. It measures a velocity input. Electronic sensors and mechanical linkage external to the module have determined that an input level of +1.5 volts DC is equal to -20 feet/second ( -6 meters/second), and that +9 volts DC is equal to +180 feet/second ( +50 meters/second). Plotting these values on a graph shows that a signal of 5 volts DC corresponds to a speed of 73.3 feet/second.

For engineering units of feet per second, the following scaling values are used:

| Low engineering units | $=$ | -20 | $\mathrm{ft} / \mathrm{sec}$ |
| :--- | :--- | :--- | :--- |
| High engineering units | $=$ | +180 | $\mathrm{ft} / \mathrm{sec}$ |
| Low span units | $=$ | 1500 | millivolts |
| High span units | $=$ | 9000 | millivolts |

An input value of 5.0 volts would be scaled to an engineering value of $+00073(\mathrm{ft} / \mathrm{sec})$.
In this example, scaling to hundredths of feet per second would provide better resolution. The following scaling values would be used:

| Low engineering units | $=$ | -2000 | hundredths $\mathrm{ft} / \mathrm{sec}$ |
| :--- | :--- | :--- | :--- |
| High engineering units | $=$ | +1800 | hundredths $\mathrm{ft} / \mathrm{sec}$ |
| Low span units | $=$ | 1500 | millivolts |
| High span units | $=$ | 9000 | millivolts |

An input value of 5.0 volts would be scaled to an engineering value of +7333 (hundredths of $\mathrm{ft} / \mathrm{sec}$ ).

## IC200ALG260

## Analog Input Module, 12 Bit Voltage/Current 8 Channels

Analog input module IC200ALG260 provides an interface to 8 voltage inputs or 8 current inputs. The inputs are single-ended, with all inputs sharing a common return.

The module receives power from the backplane power supply. No external power source is required for module operation. Power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module provides 8 words of analog input data.

## LED Indicators

The green INT PWR LED indicates the presence of internally-generated field power for the analog field-side circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of Internal Power fault for field-side circuits.

## Configuration Parameters

Two jumpers on the carrier terminals can be used to configure voltage or current mode and unipolar or bipolar operation in voltage mode. One jumper selects either voltage or current operating mode. With this jumper connected, the module accepts current inputs in the 4 mA to 20 mA range. With no jumper installed the module accepts -10 VDC to +10 VDC inputs.

In voltage mode, a different jumper on the carrier can be used to select the 0 to 10VDC range.

## Jumper Selections

Jumpers on JMP 1 and JMP 2 select voltage or current operation and voltage range. In current mode, JMP2 is ignored.

| Jumper | Range |
| :--- | :--- |
| None | $+/-10 \mathrm{~V}$ |
| 1 | $4-20 \mathrm{~mA}$ |
| 2 | $0-10 \mathrm{~V}$ |
| $1 \& 2$ | Not recommended |

## Wiring Examples

An external source must be provided to power input transceivers.

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## IC200ALG260

Analog Input Module, 12 Bit Voltage/Current 8 Channels

## Scaling

The graphs below show the relationship between the input voltage or current measured at the field terminals and the data that is output by the module.

Count and Input Current

The following equation can be used to calculate counts values:

$$
\text { Counts }=(\text { Current in mA }-4 m A) \times(32768 / 16.38 m A)
$$

For a change in the reported count value to be seen, input current must be increased by at least 2.5 mV . If the module receives an increase less than 2.5 mV , the previous count value is still reported. For example:

| Current | Count |
| :---: | :---: |
| 12.190 mA | 16384 |
| 12.192 mA | 16384 |
| 12.199 mA | 16392 |

## Count and Input Voltage

The following equations can be used to calculate counts values:

$$
\begin{array}{ll}
\text { Bipolar voltage: } & \text { Counts }=( \pm \text { Voltage In }) \times(3200) \\
\text { Unipolar voltage: } & \text { Counts }=(+ \text { Voltage In }) \times(3200)
\end{array}
$$

For a change in the reported count value to be seen, input current must be increased by at least 2.5 mV . If the module receives an increase less than 2.5 mV , the previous count value is still reported. For example:

| Voltage | Count |
| :--- | :---: |
| 5.1200 V | 16384 |
| 5.1220 V | 16384 |
| 5.1225 V | 16392 |

## IC200ALG261

## Analog Input Module, 15 Bit Differential Voltage 8 Channels

Analog input module IC200ALG261 provides an interface to 8 differential voltage inputs.

The module receives power from the backplane power supply. No external power source is required for module operation. Power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module provides 8 words of analog input data.

## IC200ALG262

Analog Input Module, 14 Bit Differential Current 8 Channels

## Jumper Selections

A jumper selects the current input range.

| Jumper | Range |
| :--- | :--- |
| None | $4-20 \mathrm{~mA}$ |
| Installed from A18 to A17 | $0-20 \mathrm{~mA}$ |

## Wiring Examples

An external source must be provided to power input transceivers.

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## IC200ALG262

Analog Input Module, 15 Bit Differential Current 8 Channels

## Scaling

The illustration below shows the relationship between the input current measured at the field terminals and the data that is output by the module.
Count and 4-20mA Input Current

The following equations can be used to calculate count values:

$$
\begin{array}{ll}
\text { 4-20mA Range: } & \text { Counts }=(\text { Current in } m A-4 m A) \times(32000 / 16 \mathrm{~mA}) \\
0-20 \mathrm{~mA} \text { Range: } & \text { Counts }=(\text { Current in } \mathrm{mA}) \times(32000 / 20 \mathrm{~mA})
\end{array}
$$

Note 1) In 4-20mA mode, signal inputs below 4.077 mA are converted to zero counts.
Note 2) In $4-20 \mathrm{~mA}$ mode, signal inputs at 20.000 mA or above 20.383 mA are converted to 32000 counts.

The count value must be a multiple of 4 . If the module receives a count value that is not a multiple of 4, It rounds the value down to the closest multiple of 4 . For example, in $4-20 \mathrm{~mA}$ mode:

| Count | mA |
| :--- | :--- |
|  |  |
| 16000 | 12.000 |
| 16003 | 12.000 |
| 16004 | 12.002 |

## Operating Range

The operating range for the IC200ALG262 module is shown in the following graph.

## IC200ALG263

Analog Input Module, 15 Bit Voltage 15 Channels

Analog input module IC200ALG263 provides an interface to 15 voltage inputs. The inputs are single-ended, with all inputs sharing a common return.

The module receives power from the backplane power supply. No external power source is required for module operation. Power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module provides 15 words of analog input data.

## LED Indicators

The green OK LED is on when backplane power is present, internally generated field power is functioning properly, the module has been configured, the module has been recognized on the backplane, and all diagnostic tests are executing as expected.

## Diagnostics

The module reports a Loss of Internal Power fault for field-side circuits.
The module reports an Internal Hardware fault upon detection of an A/D conversion malfunction. The module detects this malfunction by applying a known stimulus to the $\mathrm{A} / \mathrm{D}$ conversion path and verifying the expected result. If an unexpected result occurs three times consecutively, the module stops scanning, turns off the OK LED, and reports an Internal Hardware fault. The module must be power cycled or replaced to clear this fault.

## Configuration Parameters

The analog inputs are software-configurable to either default or hold last state upon loss of module.

| :---: | :---: |
| or Auxiliary I/O | Connections |
| Terminal Strip |  |

An optional Shorting Bar or Auxiliary I/O Terminal Strip can be used for wiring convenience when multiple Return paths need to be wired together.

An external source must be provided to power input transceivers.

## IC200ALG263

Analog Input Module, 15 Bit Voltage 15 Channels

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## Scaling

The graphs below show the relationship between the input voltage measured at the field terminals and the data that is output by the module.

## Count and Input Voltage

The following equation can be used to calculate count values:

$$
\text { Counts }=(\text { Input Voltage }) \times(32000 / 10 \mathrm{~V})
$$

## IC200ALG264

Analog Input Module, 15 Bit Current 15 Channels

Analog input module IC200ALG264 provides an interface to 15 current inputs. The inputs are single-ended, with all inputs sharing a common return.

The module receives power from the backplane power supply. No external power source is required for module operation. Power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or NIU. The module provides 15 words of analog input data.

## LED Indicators

The green OK LED is on when backplane power is present, internally generated field power is functioning properly, the module has been configured, and the module has been recognized on the backplane.

## Diagnostics

The module reports a Loss of Internal Power fault for field-side circuits.
The module reports an Open Wire fault for each channel, when in $4-20 \mathrm{~mA}$ mode.

## Configuration Parameters

A jumper on the carrier terminals can be used to configure $4-20 \mathrm{~mA}$ or $0-20 \mathrm{~mA}$ input ranges. With no jumper installed, the module accepts $4-20 \mathrm{~mA}$ input signals. With a jumper installed, the module accepts $0-20 \mathrm{~mA}$ input signals.

The analog inputs are software-configurable to either default or hold last state upon loss of module.

## Module Specifications

## IC200ALG320

Analog Output Module, 12 Bit Current, 4 Channels

Analog output module IC200ALG320 provides four 4 mA to 20 mA analog currentsourcing outputs. Including a modest amount of overrange current, approximately 20.38 mA of output current per channel is available to drive output loads.

An external source of DC power is required for the outputs.
Intelligent processing for this module is performed by the CPU or NIU. The module receives 4 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module is easily set up with a jumper for the outputs to either hold their last states or default to 4 mA if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## IC200ALG320

Analog Output Module, 12 Bit Current, 4 Channels

## Jumper Selection

If no jumper is installed outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to 4 mA . This should only be changed with field power and backplane power removed.

| Jumper | Default |
| :---: | :---: |
| None | Hold Last State |
| JMP 1 | 4 mA |

## Wiring Example

## IC200ALG320

Analog Output Module, 12 Bit Current, 4 Channels

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

Analog Output Module, 12 Bit Current, 4 Channels

## Scaling

The graph below shows the relationship between the output data that is provided to the module from the backplane, and the actual output current. The range spans between 4 mA and 20 mA .

## Count vs Output Current

The following equation can be used to calculate specific output currents:

$$
I_{\text {out }}=4 \mathrm{~mA}+(\text { count } / 32760) \times 16.38 \mathrm{~mA}
$$

The count value must be a multiple of 8 . If the module receives a count value that is not a multiple of 8 , it rounds the value down to the closest multiple of 8 . For example:

| Count | mA |
| :---: | :---: |
| 16000 | 12.000 |
| 16007 | 12.000 |
| 16008 | 12.004 |

## IC200ALG320

Analog Output Module, 12 Bit Current, 4 Channels

## Thermal Derating

The minimum recommended load resistance per channel depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. The thermal derating is not affected by the type of carrier on which the module is installed.

The total load requirement includes the impedance of the transducer being driven. At higher ambient temperatures, it may be necessary to add resistance in series with the load to reach the minimum load requirement.

Analog output module IC200ALG321 provides four analog voltage outputs. The output range is 0 to +10 VDC

An external 24 V power supply is required for the outputs.
Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module receives 4 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module is easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## IC200ALG321

Analog Output Module, 12 Bit Voltage 0 to 10VDC 4 Channels

## Jumper Selection

A jumper on the carrier can be used to select the output default mode.
If no jumper is installed on pins B13 and B14 outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to 0 volts. This should only be changed with field power and backplane power removed.

| Jumper | Selects |
| :--- | :--- |
| None | Hold Last State |
| JMP 1 | Default to 0 |

## Wiring Example

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG321

Analog Output Module, 12 Bit Voltage 0 to 10VDC 4 Channels

## Scaling

The graphs below show the relationship between the output voltage measured at the field terminals and the data that is output by the module.

## Count vs Output Voltage

Voltage can be calculated using the following equation:
Vout $=(($ analog counts $\times 10.25) / 32768)$
The count value must be a multiple of 8 . If the module receives a count value that is not a multiple of 8 , it rounds the value down to the closest multiple of 8 . For example:

| Count | Voltage |
| :---: | :---: |
| 16024 | 5.0125 V |
| 16030 | 5.0125 V |
| 16032 | 5.0150 V |

Analog output module IC200ALG322 provides four analog voltage outputs. The output range is -10 to +10 VDC

An external 24 V power supply is required for the outputs.
Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module receives 4 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module is easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## IC200ALG322

Analog Output Module, 12 Bit Voltage -10 to +10VDC 4 Channels

## Jumper Selection

A jumper on the carrier can be used to select the output default mode.
If no jumper is installed on pins B13 and B14 outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to 0 volts. This should only be changed with field power and backplane power removed.

| Jumper | Selects |
| :--- | :--- |
| None | Hold Last State |
| JMP 1 | Default to 0 |

## Wiring Example

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG322

Analog Output Module, 12 Bit Voltage -10 to +10VDC 4 Channels

## Scaling

The graphs below show the relationship between the output voltage measured at the field terminals and the data that is output by the module.

## Count vs Output Voltage

Voltage can be calculated using the following equation:

$$
\text { Vout }=((\text { analog counts } \times 20.5) / 65535)
$$

The count value must be a multiple of 16 . If the module receives a count value that is not a multiple of 16 , it rounds the value down to the closest multiple of 16 . For example:

| Count | Voltage |
| :---: | :---: |
| 16032 | 5.0150 V |
| 16040 | 5.0150 V |
| 16048 | 5.0200 V |

IC200ALG325 Analog Output Module, 13 Bit Voltage 8 Channels

Analog output module IC200ALG325 provides eight analog voltage outputs. The output range can be either -10 VDC to +10 VDC (bipolar) or 0 V to +10 VDC (unipolar).

An external 24 V power supply is required for the outputs.
Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module receives 8 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module has a default output range of -10 VDC to +10 VDC (bipolar), but is easily set up with a jumper for the channels to output 0 V to +10 VDC (unipolar).

The module is also easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.
Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## Jumper Selection

Jumpers on the carrier can be used to select the output range and output default mode.

## Range Jumper

If no jumper is installed on pins B1 and B2, outputs are configured for the bipolar range of -10 V to +10 V . With a jumper installed, the outputs are configured for the unipolar range of 0 V to +10 V .

| Range Jumper (JMP 1) | Range |
| :---: | :---: |
| None | -10 V to +10 V |
| Installed | 0 V to +10 V |

## Hold Jumper

If no jumper is installed on pins B2 and B3, outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, outputs default to 0 V . This should only be changed with the field power and backplane power removed.

| Hold Jumper (JMP 2) | Output Default |
| :---: | :---: |
| None | Hold Last State |
| Installed | OV |

## Wiring Example

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG325

## Analog Output Module, 13 Bit Voltage 8 Channels

## Scaling for Unipolar Outputs

The graph below shows the relationship between the output voltage measured at the field terminals and the data that is output by the module, when outputs are set up for the unipolar range.

## Count vs Output Voltage, Unipolar

Voltage can be calculated using the following equation:
Vout $=(($ analog counts $\times 10.24) / 32768)$
The count value must be a multiple of 4 . If the module receives a count value that is not a multiple of 4 , it rounds the value down to the closest multiple of 4 . For example:

| Count | Voltage |
| :---: | :---: |
| 16024 | 5.0075 V |
| 16026 | 5.0075 V |
| 16028 | 5.00875 V |

## IC200ALG325

Analog Output Module, 13 Bit Voltage 8 Channels

## Scaling for Bipolar Outputs

The graph below shows the relationship between the output voltage measured at the field terminals and the data that is output by the module, when outputs are set up for the bipolar range.

Count vs Output Voltage, Bipolar

Voltage can be calculated using the following equation:

$$
\text { Vout }=((\text { analog counts } \times 20.48) / 65536)
$$

The count value must be a multiple of 4 . If the module receives a count value that is not a multiple of 4 , it rounds the value down to the closest multiple of 4 . For example:

| Count | Voltage |
| :---: | :---: |
| 16024 | 5.0075 V |
| 16026 | 5.0075 V |
| 16028 | 5.00875 V |

## IC200ALG326

Analog Output Module, 13 Bit Current, 8 Channels

Analog output module IC200ALG326 provides eight 4 mA to 20 mA analog currentsourcing outputs. Including a modest amount of overrange current, approximately 20.38 mA of output current per channel is available to drive output loads.

An external source of DC power is required for the outputs.
Intelligent processing for this module is performed by the CPU or NIU. The module receives 8 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module can be configured for either the $4-20 \mathrm{~mA}$ or $0-20 \mathrm{~mA}$ output current range by installing a jumper wire on the field terminals.

The module can also be easily set up with a jumper for the outputs to either hold their last states or default to low end of range if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## Jumper Selection

## Range Jumper

If no jumper is installed the output current range will be 4 to 20 mA . With a jumper installed the output current range is 0 to 20 mA . This should only be changed with field power and backplane power removed. The corresponding parameter in the hardware configuration must also be adjusted accordingly.

| Range Jumper | Default |
| :---: | :---: |
| None | 4 to 20 mA |
| JMP 1 | 0 to 20 mA |

## Hold Jumper

If no jumper is installed outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to $0 / 4 \mathrm{~mA}$. This should only be changed with field power and backplane power removed. The corresponding parameter in the hardware configuration must be adjusted accordingly.

| Hold Jumper | Default |
| :---: | :---: |
| None | Hold Last State |
| JMP 2 | $0 / 4 \mathrm{~mA}$ |

The "Default Low End of Range" value can be either 4mA or 0mA. The default depends on the PLC status, output current range selected, and whether the module is controlled by a VersaMax PLC CPU or a Network Interface Unit (NIU) module. In some cases, the module will output 0 mA instead of 4 mA , even when configured for the $4-20 \mathrm{~mA}$ range as shown in the following chart.

## IC200ALG326

Analog Output Module, 13 Bit Current, 8 Channels

## Wiring Example

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHSO22, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG326

Analog Output Module, 13 Bit Current, 8 Channels

## Output Current Range Scaling / Step Change

In $0-20 \mathrm{~mA}$ range mode, a current output signal value of 0 mA corresponds to a $\% \mathrm{AQ}$ value of 0 counts, and 20 mA corresponds to a $\% \mathrm{AQ}$ value of $+32,000$ counts. In $4-20 \mathrm{~mA}$ range mode, a value of $0 \% \mathrm{AQ}$ counts corresponds to an output current of 4 mA and a value of $+32,000 \% \mathrm{AQ}$ counts corresponds to an output current of 20 mA . If the module is installed in a Versamax PLC, it converts negative value commands to 0 mA regardless of range selected. If the module is controlled by a Network Interface Unit (NIU), it converts any negative value commands to the low end of range.

The illustration below shows the relationship between output signal strength and commanded \%AQ counts. It depicts the step change in output current level for various command values. Not every command value results in a change in the output current level due to the module's resolution.

## 4-20 mA Range Step Change Example

| Count | Current |
| :---: | :---: |
| 16000 | 12.0000 mA |
| 16005 | 12.0025 mA |
| 16008 | 12.0025 mA |
| 16009 | 12.0025 mA |
| 16010 | 12.0050 mA |

## IC200ALG327

Analog Output Module, 13 Bit Voltage 12 Channels

Analog output module IC200ALG327 provides twelve analog voltage outputs. The output range can be either -10 VDC to +10 VDC (bipolar) or 0 V to +10 VDC (unipolar).

An external 24 V power supply is required for the outputs.
Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module receives 12 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module has a default output range of -10 VDC to +10 VDC (bipolar), but is easily set up with a jumper for the channels to output 0 V to +10 VDC (unipolar).
The module is also easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

| Wiring Connections for Carriers with <br> Three Rows of <br> Terminals <br> IC200CHS001, 022, 025 <br> IC200CHS011 |  |

## Jumper Selection

Jumpers on the carrier can be used to select the output range and output default mode.

## Range Jumper

If no jumper is installed on pins B1 and B2, outputs are configured for the bipolar range of -10 V to +10 V . With a jumper installed, the outputs are configured for the unipolar range of 0 V to +10 V .

| Range Jumper (JMP 1) | Range |
| :---: | :---: |
| None | -10 V to +10 V |
| Installed | 0 V to +10 V |

## Hold Jumper

If no jumper is installed on pins B2 and B3, outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, outputs default to 0V. This should only be changed with the field power and backplane power removed.

| Hold Jumper (JMP 2) | Output Default |
| :---: | :---: |
| None | Hold Last State |
| Installed | OV |

## Wiring Example

## IC200ALG327

Analog Output Module, 13 Bit Voltage 12 Channels

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.
All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## Scaling for Unipolar Outputs

The graph below shows the relationship between the output voltage measured at the field terminals and the data that is output by the module, when outputs are set up for the unipolar range.
Count vs Output Voltage, Unipolar

Voltage can be calculated using the following equation:
Vout $=(($ analog counts $\times 10.24) / 32768)$
The count value must be a multiple of 4 . If the module receives a count value that is not a multiple of 4 , it rounds the value down to the closest multiple of 4 . For example:

| Count | Voltage |
| :---: | :---: |
| 16024 | 5.0075 V |
| 16026 | 5.0075 V |
| 16028 | 5.00875 V |

## IC200ALG327

## Analog Output Module, 13 Bit Voltage 12 Channels

## Scaling for Bipolar Outputs

The graph below shows the relationship between the output voltage measured at the field terminals and the data that is output by the module, when outputs are set up for the bipolar range.

Count vs Output Voltage, Bipolar

Voltage can be calculated using the following equation:

$$
\text { Vout }=((\text { analog counts } \times 20.48) / 65536)
$$

The count value must be a multiple of 4 . If the module receives a count value that is not a multiple of 4 , it rounds the value down to the closest multiple of 4 . For example:

| Count | Voltage |
| :---: | :---: |
| 16024 | 5.0075 V |
| 16026 | 5.0075 V |
| 16028 | 5.00875 V |

Analog output module IC200ALG328 provides twelve 4 mA to 20 mA analog currentsourcing outputs. Including a modest amount of overrange current, approximately 20.38 mA of output current per channel is available to drive output loads.

An external source of DC power is required for the outputs.
Intelligent processing for this module is performed by the CPU or NIU. The module receives 12 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## Configuration Parameters

The module can be configured for either the $4-20 \mathrm{~mA}$ or $0-20 \mathrm{~mA}$ output current range by installing a jumper wire on the field terminal strip.

The module can also be easily set up with a jumper for the outputs to either hold their last states or default to the low end of their range if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted.

Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

## IC200ALG328

Analog Output Module, 13 Bit Current, 12 Channels

## Jumper Selection

## Range Jumper

If no jumper is installed the output current range will be 4 to 20 mA . With a jumper installed the output current range is 0 to 20 mA . This should only be changed with field power and backplane power removed. The corresponding parameter in the hardware configuration must also be adjusted accordingly.

| Range Jumper | Default |
| :---: | :---: |
| None | 4 to 20 mA |
| JMP 1 | 0 to 20 mA |

## Hold Jumper

If no jumper is installed outputs hold their last states (the last commanded values from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to $0 / 4 \mathrm{~mA}$. This should only be changed with field power and backplane power removed. The corresponding parameter in the hardware configuration must also be adjusted accordingly.

| Hold Jumper | Default |
| :---: | :---: |
| None | Hold Last State |
| JMP 2 | $0 / 4 \mathrm{~mA}$ |

The "Default Low End of Range" value can be either 4mA or 0mA. The default depends on the PLC status, output current range selected, and whether the module is controlled by a VersaMax PLC CPU or a Network Interface Unit (NIU) module. In some cases, the module will output 0 mA instead of 4 mA , even when configured for the $4-20 \mathrm{~mA}$ range as shown in the following chart.

| Action | Module Set to Default Low End of Range (Default) |  |  |  | Module Set to Hold Last State (HLS) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Module in NIU Rack |  | Module in CPU Rack |  | Module in NIU Rack |  | $\begin{gathered} \text { Module in CPU } \\ \text { Rack } \end{gathered}$ |  |
|  | 0-20mA | 0-20mA | 4-20mA | 0-20mA | 4-20mA | 4-20mA | 0-20mA | 4-20mA |
| Run to Stop | OmA | 0 mA | 4 mA | OmA | HLS | HLS | HLS | HLS |

| Loss of Communication | OmA | OmA | 4 mA | N/A | HLS | HLS | N/A | N/A |
| Loss of Module | OmA | OmA | OmA | OmA | OmA | OmA | OmA | OmA |
| Loss of CPU/NIU Power | OmA | OmA | OmA | OmA | HLS | HLS | HLS | HLS |

Wiring Example

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.
All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG328

Analog Output Module, 13 Bit Current, 12 Channels

## Output Current Range Scaling / Step Change

In $0-20 \mathrm{~mA}$ range mode, a current output signal value of 0 mA corresponds to a $\% \mathrm{AQ}$ value of 0 counts, and 20 mA corresponds to a $\% \mathrm{AQ}$ value of $+32,000$ counts. In $4-20 \mathrm{~mA}$ range mode, a value of $0 \% \mathrm{AQ}$ counts corresponds to an output current of 4 mA and a value of $+32,000 \% \mathrm{AQ}$ counts corresponds to an output current of 20 mA . If the module is installed in a Versamax PLC, it converts negative value commands to 0 mA regardless of range selected. If the module is controlled by a Network Interface Unit (NIU), it converts any negative value commands to the low end of range.

The illustration below shows the relationship between output signal strength and commanded \%AQ counts. It depicts the step change in output current level for various command values. Not every command value results in a change in the output current level due to the module's resolution.

## 4-20 mA Range Step Change Example

| Count | Current |
| :---: | :---: |
| 16000 | 12.0000 mA |
| 16005 | 12.0025 mA |
| 16008 | 12.0025 mA |
| 16009 | 12.0025 mA |
| 16010 | 12.0050 mA |

## Thermal Derating

The number of channels that can be active at the same time depends on the ambient temperature, the external voltage, and the orientation of the module and DIN rail. There is no thermal derating for this module at 24 V . The chart below shows thermal deratings for this module, on certain carriers, at 30VDC with the module and DIN rail in the orientations shown. There is no derating at 30 V in other orientation and carrier combinations.

To meet thermal derating requirements, inactive channels should be distributed evenly across the total number of output. For example, the "A" orientation graph below reflects the derating with channels 1,5 , and 9 inactive.

## IC200ALG331

Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels
Analog output module IC200ALG331 provides four analog outputs. Features include:

- Four isolated $4-20 \mathrm{~mA}$ current output channels
- Software configuration, no jumpers or switches
- Sixteen bit converter resolution
- High accuracy factory calibration

The module provides the following additional software-configurable features:

- Per-channel selection of $4-20 \mathrm{~mA}$ current or $+/-10 \mathrm{~V}$ voltage outputs
- Selection of default/hold last state operation
- Per-channel selection of default values
- Per-channel selection of under-range and over-range diagnostics levels
- Per-channel selection of alarm levels
- Per-channel scaling
- Field re-calibration on command

An external 24 V power supply is required for the outputs. In current mode, a separate power supply may be required for isolated outputs.
The module receives 4 words of analog output data from the system CPU or NIU.

## LED Indicators

The green FLD PWR LED indicates the presence of both logic power and field power for the analog field-side circuits. It does not indicate the presence of other supplies such as current loop supplies on output points. The absence of either backplane or field power turns off the FLD PWR LED. Note that this module is the only one that has the OK LED located before the FLD PWR LED in the A slot.

The OK LED indicates module status:

- On green indicates normal operation.
- Flashing green indicates boot mode or update
- Flashing amber indicates self-diagnostic error.
- Off indicates no 3.3 V power

## Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels

Module Specifications

| Module Characteristics |  |

## IC200ALG331

Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels

## Field Wiring

| Terminal | Connection | Terminal | Connection |
| :---: | :---: | :---: | :---: |
| A1 | No connection | B1 | $\mathrm{I} 1+$ |
| A2 | Shield Termination Point | B2 | $\mathrm{I} 1-$ |
| A3 | No connection | B3 | $\mathrm{V} 1+$ |
| A4 | Shield Termination Point | B4 | $\mathrm{V} 1-$ |
| A5 | No connection | B5 | $\mathrm{I} 2+$ |
| A6 | Shield Termination Point | B6 | $\mathrm{I} 2-$ |
| A7 | No connection | B7 | $\mathrm{V} 2+$ |
| A8 | Shield Termination Point | B8 | $\mathrm{V} 2-$ |
| A9 | No connection | B9 | $\mathrm{I} 3+$ |
| A10 | Shield Termination Point | B10 | $\mathrm{I} 3-$ |
| A11 | No connection | B11 | $\mathrm{V} 3+$ |
| A12 | Shield Termination Point | B12 | $\mathrm{V} 3-$ |
| A13 | No connection | B13 | $\mathrm{I} 4+$ |
| A14 | Shield Termination Point | B14 | $\mathrm{I4}-$ |
| A15 | No connection | B15 | $\mathrm{V} 4+$ |
| A16 | Shield Termination Point | B16 | $\mathrm{V} 4-$ |
| A17 | No connection | B17 | DC - |
| A18 | No connection | B18 | DC+ |

A 24 volt power supply must be connected to B17 and B18 to operate the module. Voltage outputs are powered from the module. For each channel, V+ is positive with respect to Vwhen the channel's output data is positive. Current outputs act as current regulators and require a supply to power the load. The current loop can be connected as a current source or current sink to the load. Loads are isolated if the loop supply is isolated. However, if the module supply is also used as the loop supply, the loads are not isolated.

## Wiring Examples

Current Source

Current Sink

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG331

Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels

## Operation

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above.

## Output Defaults

The module requires both logic and module 24 volt power supplies to produce an output. Subsequent loss of power or communication will produce output states as determined by the configuration. These are:

| Power and configuration states | Output condition |
| :--- | :--- |
| Field power, no logic power, not configured | All outputs 0 |
| Field and logic power, not configured | All outputs 0 |
| Field and logic power, configured | Outputs are scaled and follow program data |
| Module defaults due to loss of <br> communications or other cause. | Outputs are set to configured default: value or <br> Hold Last State. <br> In I/O Station with NIU, outputs are set to 0. |
| Loss of backplane power after configuration | Outputs are set to Hold Last State if configured <br> for Hold Last State operation, or to 0 if "default" <br> was configured. A configured default value is not <br> available to the module if backplane power has <br> been lost. <br> In I/O Station with NIU, outputs set to 0. |
| Communication returns without loss of <br> Field Power | Outputs resume operation after configuration. |

## Calibration

The module is calibrated at the factory. For most applications, no further calibration is required. It is possible to perform recalibration in either of the following ways:

- By changing a module's scaling so its scaled data agrees with metered values.
- By sending the module a recalibration message as described in the PLC User's Manual.

## Diagnostics

By default, the module is configured for fault reporting. The module reports faults as soon as they are detected. Once a fault has been reported, the same fault is not reported again until the fault has been cleared. Fault reporting can be disabled via configuration. If disabled, faults are not reported. The module can detect and report the following faults:

## Over-Range

The module reports an Over Range fault if an output value is greater than approximately +12.5 volts or 25 mA .

## Under-Range

The module reports an Under Range fault if an output value is approximately 0 mA on an current channel or -12.5 volts on a voltage channel.

## Open Wire

The module reports an Open Wire fault on current outputs if the configuration of the low end of the range is greater than or equal to approximately 2.0 mA , but the output is not detecting current.

## Loss of Field Power Supply

The module reports a Loss of Field Power fault if field power is not present (also indicated by the FLD PWR LED). Outputs default as specified by the configuration.

## High Limit

The module reports a High Alarm fault if an output value is greater than or equal to the value specified by the "Alarm High" configuration parameter.

## Low Limit

The module reports a Low Alarm fault if an output value is less than or equal to the value specified by the "Alarm Low" configuration parameter.

## Non-volatile Memory Fault

The module reports this fault only during field recalibration, if a non-volatile memory fault is detected.

## IC200ALG331

Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels

## Configurable Parameters

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above.

| Module Parameter | Description | Default | Choices |
| :---: | :---: | :---: | :---: |
| Analog Output Data Reference | Starting offset for the module's analog output data. |  | user selectable |
| Analog Output Data Length | Word length of the module's analog output data. | 4 | 0-4 |
| Report Faults | Enables or disables Fault Reporting for the entire Module. | Enabled | Enabled, Disabled |
| \%AQ Default /Hold Last State | Specifies whether the module will go to the specified channel defaults (see below) or hold their last states if power or communications are lost. | Default | Default/Hold |
| Current / Voltage | Specifies whether the channel will be a voltage or current output. <br> If the Channel type is Current, the range is 4 to 20 mA . <br> If Channel type is Voltage, the range is -10 to +10 V . | I (Current) | I (Current), <br> V (Voltage) |
| Channel Active | Specifies if the channel should output data received from the CPU or NIU. If a channel is "inactive" space is still allocated for it. | Active | Inactive (off), Active (on) |
| Span Low | Actual current (in microAmps) or voltage (in milliVolts) to be scaled to low engineering units value. | $4000 \mu \mathrm{~A}$ | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Span High | Actual current in microAmps or voltage in millivolts to be scaled to the high engineering units value. | $20000 \mu \mathrm{~A}$ | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Engineering Low | The engineering units value that is considered equivalent to the low span (actual) value. | 4000 | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Engineering High | The engineering units value that is considered equivalent to the high span (actual) value. | 20000 | $\begin{gathered} 0 \text { to } 25,000 \mu \mathrm{~A} \\ -10,000 \text { to }+10,000 \mathrm{mV} \end{gathered}$ |
| Default | The value to be output by the firmware when the module is in a default condition and the Output Default Control is set to Default. | $0 \mu \mathrm{~A}$ | -32768 to +32767 |

## Configuring Scaling

The module converts digital output values received from the CPU or NIU to electrical signals (either current or voltage, as configured). By default, the module converts this data to 1 millivolt or 1 microamp "internal units" for convenience in scaling and comparing to actual meter measurements.

The module's default scaling can be changed to tailor the output data to a specific application. Typically, engineering units represent millivolts or microamps. But they may also represent physical units such as degrees or centimeters per second. When reconfiguring scaling, it is important to be sure that the chosen Engineering Units values would not result in Overrange or Underrange output levels.

The scaling for each channel can be configured independently. Scaling is configured by selecting corresponding low and high engineering units values and low and high internal values (counts) for two points.

During operation, the module will use the straight line defined by these two pairs of configured scaling values to convert internal values to current or voltage signal levels that represent appropriate engineering units.

## Scaling Values for $1 m V$ or $1 \mu A$ Engineering Units

For many applications, the engineering units are either millivolts or microAmps. These units are easy to scale. Simply use the table below to find scaling values that are appropriate for the channel's configured range.

| Examples | Output <br> Range | Enter this engineering <br> units value |  | Span Units <br> (microAmps) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 4 mA to 20 mA | 4 mA | Low $+4,000$ <br> High $+20,000$ | Low <br> High | $+4,000$ |
|  | 20 mA | $+20,000$ |  |  |$⿻$| -10 volts to +10 volts |
| :--- |

## IC200ALG331

Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels

## Scaling Example

A channel is configured in the 0 to 10 volts DC range. It measures a velocity output. Electronic sensors and mechanical linkage external to the module have determined that an output level of +1.5 volts DC is equal to -20 feet/second ( -6 meters/second), and that +9 volts DC is equal to +180 feet/second ( +50 meters/second). Plotting these values on a graph shows that a signal of 5 volts DC corresponds to a speed of 73.3 feet/second.

For engineering units of feet per second, the following scaling values are used:

| Low engineering units | $=$ | -20 | $\mathrm{ft} / \mathrm{sec}$ |
| :--- | :--- | :--- | :--- |
| High engineering units | $=$ | +180 | $\mathrm{ft} / \mathrm{sec}$ |
| Low span units $=$ |  | 1500 | millivolts |
| High span units $=$ |  | 9000 | millivolts |

An output value of 5.0 volts would be scaled to an engineering value of $+00073(\mathrm{ft} / \mathrm{sec})$.
In this example, scaling to hundredths of feet per second would provide better resolution. The following scaling values would be used:

| Low engineering units | $=$ | -2000 | hundredths $\mathrm{ft} / \mathrm{sec}$ |
| :--- | :--- | :--- | :--- |
| High engineering units | $=$ | +1800 | hundredths $\mathrm{ft} / \mathrm{sec}$ |
| Low span units | $=$ | 1500 | millivolts |
| High span units | $=$ | 9000 | millivolts |

An output value of 5.0 volts would be scaled to an engineering value of +7333 (hundredths of $\mathrm{ft} / \mathrm{sec}$ ).

## Chapter <br> 12

## Analog Mixed I/O Modules

This chapter describes analog mixed input/output modules.

- IC200ALG430 Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2 Channels
- IC200ALG431 Analog Mixed Module, 12 Bit 0 to 10VDC Input 4 Channels and Output 2 Channels
- IC200ALG432 Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels

## IC200ALG430

Analog Mixed Module, 12 Bit Input Current 4 Channels and
Output Current 2 Channels

Analog mixed module IC200ALG430 provides four analog current inputs and two analog current outputs.

An external 24 V power supply is required for the outputs. For inputs, power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module provides 4 words of analog input data and receives 2 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits. The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## I/O Defaults

The module is easily set up with a jumper for the outputs to either hold their last states or default to 4 mA if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted. Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

When software-configured, inputs can be configured to hold last state or report a selectable value. When the module is autoconfigured using a CPU or NIU that is version 2.x or later, inputs default to 0 . If the CPU or NIU is version 1.5 or earlier, the input default matches the jumper-configured output default ( 0 or Hold Last State).

## IC200ALG430

Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2 Channels

## Jumper Selection

A jumper on the carrier can be used to select the output default mode. If no jumper is installed on pins B13 and B14 outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to 4 mA . This should only be changed with field power and backplane power removed.

| Jumper | Selects |
| :--- | :--- |
| None | Hold Last State |
| JMP 1 | Default to 4mA |

## Wiring Examples

## Current Inputs

An external source is needed to power input transceivers.

Current Outputs

## IC200ALG430

Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2 Channels

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If possible, the analog input channel connections should be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module.

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG430 <br> Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2 Channels

## Scaling

The following graphs show the relationship between the input current measured at the field terminals and the data values for the module.

## Count vs Input Current

The following equation can be used to calculate counts values:

$$
\text { Counts }=(\text { Current in } m A-4 m A) \times(32768 / 16.38 m A)
$$

For a change to be seen in the reported count value, input current must be increased by at least $4 \mu \mathrm{~A}$. If the module receives an increase less than $4 \mu \mathrm{~A}$, the previous count value is still reported. For example:

| Current | Count |
| :---: | :---: |
| 12.190 mA | 16384 |
| 12.192 mA | 16384 |
| 12.194 mA | 16392 |

## IC200ALG430

Analog Mixed Module, 12 Bit Input Current 4 Channels and Output Current 2 Channels

## Count vs Output Current

The graph below shows the relationship between the output data that is provided to the module from the backplane, and the actual output current. The range spans between 4 mA and 20 mA .

The following equation can be used to calculate specific output currents:

$$
I_{\text {out }}=4 \mathrm{~mA}+(\text { count } / 32760) \times 16.38 \mathrm{~mA}
$$

The count value must be a multiple of 8 . If the module receives a count value that is not a multiple of 8 , it rounds the value down to the closest multiple of 8 . For example:

| Count | mA |
| :---: | :---: |
| 16000 | 12.000 |
| 16007 | 12.000 |
| 16008 | 12.004 |

Analog mixed module IC200ALG431 provides four 0 to +10 VDC analog inputs and two 0 to +10 VDC analog outputs.

An external 24 V power supply is required for the outputs. For inputs, power for the user's transceivers must be supplied from an external source.

Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module provides 4 words of analog input data and receives 2 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits. The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## I/O Defaults

The module is easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted. Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

When software-configured, inputs can be configured to hold last state or report a selectable value. When the module is autoconfigured using a CPU or NIU that is version 2.x or later, inputs default to 0 . If the CPU or NIU is version 1.5 or earlier, the input default matches the jumper-configured output default ( 0 or Hold Last State).

Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG431

Analog Mixed Module, 12 Bit 0 to 10VDC Input 4 Channels and Output 2 Channels

## Scaling

The following graphs show the relationship between the voltage applied at the field terminals and the data values for the module.

## Count vs Input Voltage

The following equation can be used to calculate counts values:
Counts = (Voltage In) x (3200)

The count value is returned as a multiple of 8 . A voltage that would return a count value (using the above equation) which is not a multiple of 8 will return the next highest multiple of 8 .

| Input <br> Voltage | Count |
| :---: | :---: |
| 5.1200 | 16384 |
| 5.1210 | 16392 |
| 5.1220 | 16392 |
| 5.1225 | 16392 |

## Analog Mixed Module, 12 Bit 0 to 10VDC Input 4 Channels and Output 2 Channels

## Count vs Output Voltage

Voltage can be calculated using the following equation:

$$
\text { Vout }=((\text { analog counts } \times 10.25) / 32768)
$$

The count value must be a multiple of 8 . If the module receives a count value that is not a multiple of 8 , it rounds the value down to the closest multiple of 8 . For example:

| Count | Voltage |
| :--- | :--- |
| 16024 | 5.0125 V |
| 16030 | 5.0125 V |
| 16032 | 5.0150 V |

## IC200ALG432

Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels

Analog mixed module IC200ALG432 provides four - 10 to +10 VDC analog inputs and two -10 to +10 VDC analog outputs.

An external 24 V power supply is required for the outputs. For inputs, power for the user's transceivers must be supplied from an external source. Intelligent processing for this module is performed by the CPU or Network Interface Unit. The module provides 4 words of analog input data and receives 2 words of analog output data.

## LED Indicators

The green FLD PWR LED indicates the presence of user-side power for the analog fieldside circuits.

The green OK LED is on when backplane power is present to the module.

## Diagnostics

The module reports a Loss of User Side Power fault for field-side circuits.

## I/O Defaults

The module is easily set up with a jumper for the outputs to either hold their last states or default to 0 V if backplane power or communications are interrupted or the PLC is stopped. External user power must remain uninterrupted. Outputs remain in their default or last state until the module receives different output data from the backplane, or until field power is removed.

When software-configured, inputs can be configured to hold last state or report a selectable value. When the module is autoconfigured using a CPU or NIU that is version 2.x or later, inputs default to 0 . If the CPU or NIU is version 1.5 or earlier, the input default matches the jumper-configured output default (0 or Hold Last State).

## IC200ALG432 <br> Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels

## Jumper Selection

If no jumper is installed outputs hold their last state (the last commanded value from the backplane) if backplane power or communications are interrupted or the PLC is stopped. With a jumper installed, if such conditions occur outputs default to 0 V . This should only be changed with field power and backplane power removed.

| Jumper | Default |
| :---: | :---: |
| None | Hold Last State |
| JMP 1 | OV |

## Wiring Example

## Voltage Inputs

An external source is needed to power input transceivers.

Voltage Outputs

Jumper present selects default to 0 _--- $\varnothing$ JMP 1A

## IC200ALG432

Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels

## Cable Shield Connections

Shielded twisted pair cable is recommended for all of the analog channel connections. If possible, the analog input channel connections should be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module.

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005) or a Compact Terminal-style I/O Carrier (IC200CHS022, 025), the cable shield can be connected directly to the carrier per the Field Wiring Table. An Auxiliary I/O Terminal Strip (IC200TBM001, 002, or 005) can also be added to the Terminal-style I/O Carriers to aid in grounding shields. Be sure to ground the Auxiliary I/O Terminal Strip as well if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

All cable shield connections should be connected to earth ground and be kept as short as practical. The power cable does not need to be shielded.

## IC200ALG432 <br> Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels

## Scaling

The following graphs show the relationship between the voltage applied at the field terminals and the data values for the module.

## Count vs Input Voltage

The following equation can be used to calculate counts values:
Counts = (Voltage In) x (3200)

The count value is returned as a multiple of 8 . A voltage that would return a count value (using the above equation) which is not a multiple of 8 will return the next highest multiple of 8 .

| Input <br> Voltage | Count |
| :---: | :---: |
| 5.1200 | 16384 |
| 5.1210 | 16392 |
| 5.1220 | 16392 |
| 5.1225 | 16392 |

## IC200ALG432

Analog Mixed Module, 12 Bit +/-10VDC Input 4 Channels and Output 2 Channels
Count vs Output Voltage

Voltage can be calculated using the following equation:
Vout $=(($ analog counts $\times 20.5) / 65535)$
The count value must be a multiple of 16 . If the module receives a count value that is not a multiple of 16 , it rounds the value down to the closest multiple of 16 . For example:

| Count | Voltage |
| :--- | :--- |
| 16032 | 5.0150 V |
| 16040 | 5.0150 V |
| 16048 | 5.0200 V |

## Chapter <br> 13

Mixed Discrete/High-speed Counter Module

This chapter describes the following VersaMax Mixed Discrete Module.

- IC200MDD841 Mixed Module, 24VDC Positive Logic Input 20 Points /

Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ <br> (4) High Speed Counter, PWM, or Pulse Train Configurable Points

Discrete I/O module IC200MDD841 has twenty 24VDC positive-logic type inputs and twelve positive-logic 24 VDC 0.5 Amp outputs.

In its default configuration, the module provides four Type A high-speed counter inputs and outputs plus twelve standard inputs and eight standard outputs.

Each counter provides direct processing of rapid pulse signals up to 80 KHz for industrial control applications such as velocity measurement, material handling, and process control.

When the module is installed in a VersaMax PLC, its inputs and outputs can be reconfigured for a wide variety of applications:

- The high-speed counter inputs can be set up as standard high-speed inputs, as four type A counters, as two type A counters plus one A-quad-B counter, or as one type A-quad-B counter with homing capability.
- Four of the outputs can be configured as pulse-width modulated (PWM), pulse train, ramping pulse train, or high speed counter outputs.

When configured for PWM operation, the frequency of each PWM output is selectable in the range of 22 Hz to 2 KHz . The \% duty cycle of each PWM output can be set from 1 to $100 \%$ depending on the frequency of the PWM output. See the PWM Outputs section of this chapter for further details.

When configured as pulse train or ramping pulse train outputs, the sum of frequencies may be up to 5,000 pulses per second. Acceleration and deceleration can be selected from 10 to $1,000,000 \mathrm{p} / \mathrm{s}^{2}$.

Power for module operation comes from the backplane. Output devices must be powered by external voltage.

Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## LED Indicators

Individual green field-side LEDs show the on/off status of each point
The green FLD PWR LED indicates the presence of field power for the DC outputs.
The OK LED indicates module status.

- On green indicates normal operation.
- Flashing green indicates boot mode or update
- On Amber indicates self diagnostic error
- Off indicates no 3.3 V power present.

## Configuration Parameters

The module has many features that are selectable by software configuration. These features include:

- Counter type
- Output stop mode
- Channel function
- Counter output enable
- Counter direction
- Counter mode
- Counter Preload/Strobe selection
- Type A counter count input edge
- Counter timebase
- High and low limits
- On and off Presets
- Preload registers
- Pulse-train acceleration
- Pulse-train deceleration

## IC200MDD841 <br> Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ <br> (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Default Operation

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above. . In its default mode, the module operates as described below.
Inputs 1-8 are one group of high-speed counter inputs. These inputs operate as:

- Four Type A counters.
- Each counter counts upward.
- When a counter reaches its upper limit, it wraps around and starts over.

Inputs 9-16 are one group of standard inputs with a common return.
Inputs 17-20 are one group of standard inputs with a common return.
Four of the outputs are High-speed Counter outputs. Each High-speed Counter output is dedicated to a corresponding High-speed Counter input.
Eight additional outputs are standard outputs.
The counter outputs use a default ON preset of $+32,767$, and an OFF preset of 0 . If the count reaches the ON preset, the counter's output is turned on. If the count reaches the OFF preset, the counter's output is turned OFF.

When the system is in Stop mode, the High-speed Counter outputs continue to respond to the counter inputs and the standard outputs turn off. Output presets continue to operate as if the CPU/NIU were present, changing state to reflect the counter Accumulators.

In default mode, the module can temporarily change this basic operation in response to up to four commands from the CPU or NIU. These commands can be sent to the module in its regular output data.

- Each counter output can be turned on or off on command.
- Each counter can be reset to 0 .
- Each counter's accumulator (current count) register can be loaded with any value from 0 to 32757 .
- Each counter's lower and upper limits can be changed.
- Each counter's accumulator can be incremented by a specific amount above its present actual value.
- The count direction can be changed to down (or back to up).
- The timebase for each counter's counts-per-timebase, which measures its rate of counting, can be changed from 1000 mS to any value from 10 mS to 1000 mS .
- Each counter's preload value can be changed.

## IC200MDD841 Mixed Module, 24VDC Positive Logic Input 20 Points Output 12 Point// (4) High Speed Counter, PWM, or Pulse Train Configurable Points

Input Connections: Inputs are positive logic. Current flows from the input device/switch to the input point.

Inputs 9-16 are one group of standard inputs with a common return.
Inputs 17-20 are one group of standard inputs with a common return.
Inputs 1-8 can be one group of fast inputs with a common return, or high speed counter inputs.

Note: Because of the fast response time of inputs 1-8, shielded cable properly-terminated at earth ground must be used for connecting to this input group in order to meet IEC 1000-4-4.

Output Connections: Outputs are positive logic Current flows from the output to the load. Four of the outputs are high-speed outputs that can be PWM, pulse train, or high speed counter outputs.

## Configurable Features

The default parameters of this module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that provides software configuration.

| Parameter | Description | Default | Setting/Value Range |
| :---: | :---: | :---: | :---: |
| Counter Type | Specifies the counter configuration. If 1 Type B \& 2 Type A is selected, counter \#1 parameters are used for the Type B counter (except Counter \#1 Direction and Counter \#1 Count Input Edge parameters) and counter \#4 parameters are used for the Type A counter. | 4 Type A | 4 Type A counters, <br> 1 Type B \& 2 Type A, <br> 1 Type B2 |
| Output Stop Mode | Defines what outputs do if the system is in stop mode. Normal means that HSC outputs continue to respond to the counter inputs and standard outputs turn off. Preset outputs, continue to operate as if the CPU/NIU were present, changing state to reflect the counter Accumulators. <br> Force Off means all Preset outputs are turned off and remain off until the CPU/NIU returns to normal operation. <br> Hold Last means Preset outputs retain current levels and do not reflect the counter Accumulators. | Normal | Normal, Force All Outputs Off, Hold |
| Channel \#1/2/3/4 Function | Specifies channel function. | HSC | HSC, PWM, Pulse Train, Standard, Ramp |
| Counter Output \#1/2/3/4 Enable | Specifies if the counter output is enabled. If disabled, the output is used as a standard output. | Enabled | Enabled, Disabled |
| Counter \#1/2/3/4 Direction | (Type A only). Specifies whether count inputs increment or decrement the accumulator. | Up | Up, Down |
| Counter \#1/2/3/4 Mode | Defines whether the counter wraps if the count limit is reached (continuous) or if it stops at the counter limit. | Continuous | Continuous, Single Shot |
| Counter \#1/2/3/4 <br> Preload/Strobe Selection | Specifies the function of the Preload/Strobe Input. | Preload | Preload, Strobe |
| Counter \#1/2/3/4 Count Input Edge for Type A | For Type A counters only, specifies which transition of this input is used. Positive is a low-to-high transition. | Positive | Positive, Negative. Type B and B2 always positive. |
| Time Base \#1/2/3/4 | Specifies the timebase for the Counts-per-Timebase register. | 1000 mS | 10 mS to 65530 mS |
| High Limit \#1/2/3/4 | Defines the counter's upper limit. It must be greater than the low limit | +32,767 | $-32,767$ to $+32,767$ |
| Low Limit \#1/2/3/4 | Defines the counter's lower limit. | 0 | $-32,768$ to $+32,766$ |
| ON Preset \#1/2/3/4 | Defines the counter's ON preset. When the count is at or above this value, the HSC output is turned on. | +32,767 | $-32,768$ to $+32,767$ |
| OFF Preset \#1/2/3/4 | Defines the counter's OFF preset. When the count is at or above this value, the HSC output is turned off. | 0 | $-32,768$ to $+32,767$ |
| Preload Register \#1/2/3/4 | This register value is the Preload value for the counter. | 0 | $-32,768$ to $+32,767$ |
| Home Value | The Home Value for the counter. | 0 | $-32,768$ to $+32,767$ |
| Acceleration | Pulse Train acceleration rate from stop to full speed. | 1,000,000 | 10 to 1,000,000 |
| Deceleration | Pulse Train deceleration rate from full speed to stop. | 1,000,000 | 10 to 1,000,000 |

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ <br> (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Type A Counters

The Type A counter is one 16-bit counter that can count up or down. Configurable high and low limits set the counter's range.

The counter can either count continuously within its limits, or count to either limit then stop (one-shot mode). In continuous counting, the Accumulator (see below) wraps when the count limit is reached and continues counting. For example, if the Count Direction is up, when the count exceeds the High Limit by 1, the Accumulator value wraps to the Low Limit. In one-shot mode, the counter stops at the limit.

In the example below, the counter has been configured to count on the low to high transition of the Pulse input. The Count signal represents an internal signal that indicates where counting occurs with respect to the pulse input.

```
Accumulator N+2
    Value }\mp@subsup{\stackrel{N}{N+}}{N}{N
```

The Type A counter has an Accumulator register, a Counts per Timebase register, a Strobe register, high limit, low limit, and ON/OFF Preset values. These are 16-bit signed numbers. The values selected for the Preload, Accumulator, On Preset, and Off Preset registers must be within the counter limits. The maximum pulse repetition rate of the Preload signal and Strobe must be less than 2 kHz , and the duty cycle for both must be such that the signal is high for at least 250 microseconds.

The Count Pulse input increments or decrements the counter's accumulator. The count input can be configured to be positive or negative edge-sensitive.

The Preload/Strobe Input can either preload a value into the accumulator or strobe the accumulator value into a register. Preload/Strobe signals are always positive edgesensitive.

The Preload register contains a predefined value to be transferred to the Accumulator when the Preload/Strobe signal is active. The module sets the Preload flag bit when a Preload occurs. The CPU can clear the flag before the next preload. The Preload input always loads the Accumulator regardless of the state of the Preload flag. The Preload register can be configured to any value within the counter's range.

If Strobe is selected, the Accumulator value is placed in the Strobe register when the Preload/Strobe signal is active. The module sets a Strobe flag when a strobe occurs. The PLC or computer can clear this flag before the next strobe. The Strobe input always loads the Strobe register with the Accumulator value regardless of the state of the Strobe flag. Strobe Inputs can be used as Pulse Capture Inputs by using the Strobe status bits as a latch.

The Accumulator register contains the current count. It can be set to a value supplied by the PLC or computer. The PLC/computer can also send an adjustment value to the Accumulator register. The adjustment value can be between -128 and +127 .

The Counts-per-Timebase register contains the number of counts that occurred during the last-completed timebase interval. The number of counts is a 16-bit signed number. The sign indicates up (+) or down (-) counts. The range of the Counts/Timebase register is 32768 and +32767 counts.

The Timebase is a span of time used to measure the rate of counting. For example, the program could monitor the number of counts that occur in 30 seconds. Timebase is configurable in 10 mS increments from 10 mS to 65530 mS . If the timebase is too large, the Counts/Timebase register will lose the overflow values.

The On/Off Preset values determine when the counter output is activated or deactivated.
The Output can be activated based on configured On and Off Preset values.

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Type B Counter

The Type B counter uses two counter input signals for A-Quad-B counting. The phase relationship between the counter inputs ( $A \& B$ ) determines whether the accumulator is incremented or decremented on a transition of either counter input.

The count direction is up if A leads B.

The count direction is down if A lags B.

The Type B counter has a Strobe register, a Preload register, a 16-bit Accumulator, and a Counts-per-Timebase register. These operate as described for Type A counters.

The Type B counter can have one output that is activated based on selected On and Off preset values.

## Type B2 Counter

The Type B2 counter uses two counter input signals for A-Quad-B counting and two other counter input signals to perform a homing sequence. The operation of this counter is identical to the Type B counter, except for the homing sequence.

The phase relationship between the counter inputs ( $\mathrm{A} \& B$ ) determines whether the accumulator is incremented or decremented on a transition of either counter input. The count direction is up if A leads B. The count direction is down if A lags B.

The Type B counter has a Strobe register, a Preload register, a 16-bit Accumulator, and a Counts-per-Timebase register. These operate as described for Type A counters.

The Type B counter can have one output that is activated based on selected On and Off preset values.

## Homing Sequence

The Type B2 counter uses two high-speed inputs to perform homing: Enable Home and Marker. These inputs are normally assigned to Channel 3 Preload/Strobe and Channel 4 Preload/Strobe. Therefore, when the module is configured as a Type B2 counter, no other counters are available.

## IC200MDD841 <br> Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

The homing sequence is performed as follows:

1. Optionally, the Load Home Value \%AQ command can be used to specify a load value that is different from the one specified in the module configuration.
2. The Home Start $\% \mathrm{Q}$ bit can be set.
3. Upon receiving the new $\% \mathrm{Q}$ bit, the module clears the $\% \mathrm{I}$ bit, Home Sequence Complete.
4. The module waits for the Enable Home signal to transition to a high state. This signal may be taken from a limit or proximity switch located near the home position.
5. The next transition to a high state on the Marker signal loads the home value into the counter accumulator, This signal may be taken from a position indicator located on an electromechanical assembly.
6. The module disables the home sequence feature and sets the \%I bit Home Sequence Complete.

The maximum pulse repetition rate of the marker signal and Enable Home must be less than 2 kHz , and the duty cycle for both must be such that the signal is high for at least 250 microseconds.

## Outputs

Four of the module's twelve outputs are high speed outputs. These outputs can be configured as high speed counter, PWM, or pulse train outputs.

## Counter Outputs

Each counter output has a preset on and off point that must lie between the counter's high and low limits. The output state indicates when the Accumulator value is between the Preset on and off points. For example, using the Type B counter:

If the output is enabled for the HSC channel being used, the output turns on as shown in the following table:

| Preset closest to <br> low limit | Output ON | Output OFF |
| :---: | :---: | :---: |
| ON | $\geq$ ON Preset | $>$ OFF Preset <br> $<$ OFF Preset |
| OFF ON Preset |  |  |

The output can be either on or off when the Accumulator value lies between the Preset points.

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## PWM Outputs

PWM outputs can be used to control DC and stepper motors. The parameters of PWM output operation are set up using the module's output data. (See "Module Data"). The frequency of each PWM output can be set in the range of 22 Hz to 2 KHz . The \% Duty Cycle of each PWM output can be set from 1 to 100 depending on the frequency of the PWM output. The graph below plots the relationship between the minimum \% Duty Cycle of a PWM output versus the frequency of that PWM output. Note that this relationship is based on a default Optical Isolator Correction factor value of $75 \mu \mathrm{~S}$. (See "Optical Isolator Correction Factor" on the next page). For some frequencies, this Optical Isolator Correction factor may be changed to further decrease the minimum duty cycle of that particular frequency.

## Minimum \% Duty Cycle versus Frequency for a PWM Output

A PWM output is enabled by setting its output enable bit (in the module output data) to ON. The output is disabled by setting its Output Enable bit to OFF.

Both frequency and duty cycle can be changed while the output is enabled.

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Pulse Train Outputs

Pulse Train outputs can be used to control stepper motors. Use of an output for this function is set up as part of the module configuration. When configured as Pulse Train outputs, the pulse frequency is specified in the module's output data, as described later in this section. (See "Module Data"). The range is 1 Hz to 5 kHz . The module's output data is also used to set the number of pulses to be emitted.
The Pulse Train starts when its Output Enable bit is ON and its Pulse Train Start bit transitions from Off to ON. When the Pulse Train starts, its Pulse Train Complete status bit is set OFF. When the Pulse Train is complete, the module sets a status bit that can be read by the CPU or computer.

Note: Once a Pulse Train is started, it continues until it has completed or until its Output Enable (\%Q) bit goes to 0 .

## Optical Isolator Correction Factor

The performance of the optical isolators used in the module varies as the temperature changes. This affects the accuracy of the duty cycle for both PWM and Pulse Train outputs. To compensate for this, the module incorporates a user configurable Optical Isolator Correction Factor. The default Correction Factor is $75 \mu \mathrm{~S}$ in duration. The Correction Factor can be changed within the range 0 to $200 \mu \mathrm{~S}$ by sending the new value in the module's output data. An example is illustrated below. In the diagram, $T 0$ is the OFF Time, which is $\frac{1}{2 f}+$ Correction, where $f$ is the pulse frequency.
$T 1=\frac{1}{2 f}, T 2=$ Optical Isolator Delay, and $T 1+T 2=$ ON Time.

## IC200MDD841 <br> Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Ramp Outputs

When an output's function is selected to be Ramp (in the module configuration), acceleration and deceleration factors are applied to the Pulse-Train output.
Acceleration and deceleration factors can be specified using Data Commands, as explained later in this section. Both acceleration and deceleration can be selected from the range of $10 \mathrm{p} / \mathrm{s}^{2}$ to $1,000,000 \mathrm{p} / \mathrm{s}^{2}$. The default for both is $1,000,000$. Acceleration and deceleration do not need to be the same. Appropriate values depend on the application and the capability of the stepper motor being driven by the module.

A Ramp function begins when the module detects that the channel's Enable Output bit (discrete output bit 21-24, see "Module Data") is On and an Off-to-On transition has occurred on the channel's Start Pulse Train bit (discrete output bit 25-28). At that point, the Pulse Train begins and the channel's Pulse Train Complete bit (discrete input bit 3336) is set Off. The module outputs the specified number of pulses, in varying pulse widths, to produce a velocity profile similar to the one shown below. After the last pulse is completed, the module sets the channel's Pulse Train Complete bit Off and begins monitoring the channel's Start Pulse Train bit for another Off-to-On transition.

The Ramp feature results in a Pulse-Train profile similar to the example shown below.

Once a Ramp function has started, it continues until all of its pulses have been generated or its Output Enable bit (discrete output bit 21-24) changes from On to Off.
A Pulse Train output can be terminated before the requested number of pulses have been completed by setting its Output Enable bit (discrete output bit 21-24) to Off. If the Enable Output bit transitions from On to Off, the module will either stop the Pulse Train immediately or transition the Ramp output to its deceleration phase-depending on the channel's configuration. If deceleration is configured, the module will output a number of pulses based on: (1) the configured deceleration and (2) the velocity at the time the Enable Output bit goes Off. When the last pulse is completed, the module will set the channel's Pulse Train Complete bit (discrete input bit 33-36) to On.

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Stop Ramp with Deceleration

The graphics below show how stopping a Ramp early affects the Ramp output if the output is configured for deceleration. The example on the left shows what happens when the Enable Bit is set OFF during the "at velocity" part of the output. The righthand example shows the impact when the Enable Bit is set OFF during the "ramp up" part of the output.

Note that if the Ramp output is already decelerating when the Enable Output bit transitions from On to Off, there is no change to the operation of the Pulse Train output.

## Configuration

When the module powers up or receives a new configuration, it automatically sets up all Ramp channels to decelerate when the Output Enable bit goes OFF. If a Ramp output should stop immediately, the channel can be reconfigured with a Data command or a COMREQ. The data block is the same for both:

|  | MSB | LSB |
| :--- | :--- | :--- |
| Command word | On | 3B |
| Data word (LSW) | dddd |  |
| Data word (MSW) | Always zero |  |

- " 0 n " is the channel number from 1 to 4 .
" "3B" is the command (in hexadecimal): Load Stop Mode
" "dddd" is the Stop Mode parameter. It can be " 1 " for Decelerate and " 2 " for Stop Immediately. If any other value is specified, error code 13 (hex) is placed in the Module Status Word.

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ <br> (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Output Defaults

If the CPU or NIU stops communicating with the High Speed Counter module, so that the module no longer receives fresh output data, counter operation continues normally.

Normal (default setting) The inputs continue to be processed by the module. The outputs continue to operate as if the CPU/NIU were present, changing state to reflect the counter Accumulators.

Preset outputs can also be configured to operate in the following modes if the CPU stops providing output data:

Force Off All Preset outputs are turned off and remain off until the CPU returns to normal operation.

Hold Last The Preset outputs retain current levels and do not reflect the counter Accumulators.

## Module Data

The module provides 40 bits of bit input data and 13 words of word input data:

| Bit <br> Inputs <br> (\%) | 1-20 | Standard Inputs \#1 to \#20 |
| :---: | :---: | :---: |
|  | 21-24 | Strobe Status \#1 to 4 |
|  | 25-28 | Preload Status \#1 to 4 |
| Word | 29-32 | HSC Output Status \#1 to 4 |
|  | 33-36 | Pulse Train Complete \#1 to 4 |
|  | 37 | Home Complete |
|  | 38-39 | reserved |
|  | 40 | Status code present in Word Input 1 |
|  | 1 | Module Status Code. Status Codes. See the section Command Word Error Definitions at the end of this chapter. |
| Inputs <br> (\%AI) | 2-5 | Counts-per-Timebase \#1 to 4. |

|  | 11 | Strobe register \#3. |
|  | 12 | Accumulator register \#4. |
|  | 13 | Strobe register \#4. |

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

The High Speed Counter module receives 32 bits of bit output data and 20 words of word output data. The output bits and output words 1 through 8 are the basic module outputs.

Output words 9-20 have a special function. They can be used to send output commands to the module that temporarily change module operation. Use of these output commands is described beginning on the next page.

|  | 1-12 | Standard Outputs \#1 to \#12 |
| :---: | :---: | :---: |

|  | 3 | PWM/Pulse Train Frequency \#2. |
|  | 4 | PWM Duty Cycle/Number of Pulses \#2. |
|  | 5 | PWM/Pulse Train Frequency \#3. |
|  | 6 | PWM Duty Cycle/Number of Pulses \#3. |
|  | 7 | PWM/Pulse Train Frequency \#4. |
|  | 8 | PWM Duty Cycle/Number of Pulses \#4. |
|  | 9-11 | Command word 1, words 1 to 3 . See next page. |
|  | 12-14 | Command word 2, words 1 to 3 |
|  | 15-17 | Command word 3, words 1 to 3 |
|  | 18-20 | Command word 4, words 1 to 3 |

## Data Commands

Temporary operating changes can be made using Data Commands. Data Commands can be sent to the module as part of its analog (AQ) data. A VersaMax PLC CPU can also send Data Commands using the COMREQ function.

## Data Command Formats

A Data Command uses 3 words of memory. The contents of these 3 words are:

In the total analog output (AQ) data used by the module, there is room for 4 of these data commands, which are arranged as follows:

| Output Words 9-11 | Command 1 |
| :--- | :--- |
| Output Words 12-14 | Command 2 |
| Output Words 15-17 | Command 3 |
| Output Words 18-20 | Command 4 |

There is no limit to the length of time a command can be present in the output words. The module acts on a command only when it detects a change in the command words.

## IC200MDD841

## Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point / (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Data Command Definitions

Data Commands can be used to temporarily change the counter parameters listed below. These changes are lost when the module is powered down and when a new configuration is stored from the programmer. The bytes in the command word are treated as independent bytes: a counter ID byte and a command code byte. Command words can be entered in hexadecimal or decimal format. In the table, for Type A, $n=$ Counter \#1-4. For Type B, $n$ = Counter \#2 (only counter 2 is B-type)

| Command Word (hex) | Command | Description |
| :---: | :--- | :--- |
| On01 | Load <br> Accumulator | Loads any value within a counter's limits directly into the Accumulator. If a <br> count in received at the same time, the count is lost. <br> Example: To set Counter 1 to 1234H, load COMREQ command registers with: <br> Command word: 0101 <br> LS data word: 1234 |
| On02 | Load High <br> Limit <br> Load Low <br> Limit | Sets the High and Low limit to any value in the counter range. Move the Low <br> Limit first when shifting down or the High Limit first when shifting up. Loading <br> limits in the wrong order can cause an error. The command is successful if all <br> parameters are within the new range. <br> Example: To change the upper limit of counter 1 to 10000 (2710H), load <br> registers with: <br> Command word: 0102 |
| OS data word: 2710 |  |  |

| IC200MDD841 |
| ---: | ---: |
| Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point// |
| (4) High Speed Counter, PWM, or Pulse Train Configurable Points |

| Command Word (hex) | Command | Description |
| :---: | :---: | :---: |
| On15 | Load OFF Preset | Sets up the output turn off points within the counter range. There is one output associated with each counter. <br> Example: To set counter 1 output to turn off at 12000 (2EEOH) counts, load: Command Code: 0115 <br> LS data word: 2EE0 |
| On1F | Load Preload | Changes the count value loaded into the counter Accumulator when the Preload input is activated. <br> Example: To make counter 1 start at $2500(09 \mathrm{C} 4 \mathrm{H})$ counts at its preload signal, load: <br> Command word: 011F <br> LS data word: 09C4 |
| On3B | Load Stop Mode (or Resume Decelerate Mode) | Changes a Pulse Train output's deceleration to stop the Ramp immediately when the Output Enable bit goes Off. The Ramp function must be enabled. <br> Example: to set up a Pulse Train output for Stop Ramp (0002) operation on ch.1: <br> Command word: 013B <br> LS data word: 0002 <br> The same command can be used to reset the output to Decelerate mode (the default) by entering the value 0001 in the LS data word. <br> Example: reset the same Pulse Train output to Decelerate (0001) operation: Command word: 013B <br> LS data word: 0001 |
| On3C | Load Acceleration | Changes a Pulse Train output's acceleration. The Ramp function must be enabled. Both acceleration and deceleration can be selected from the range of $10 \mathrm{p} / \mathrm{s}^{2}$ to $1,000,000 \mathrm{p} / \mathrm{s}^{2}$. The default for both is $1,000,000$. <br> In the acceleration and deceleration commands, the data value is a 32 -bit number. These are the ONLY Data Commands that should have any value other than 0 in the MS data word. <br> Example: to change the acceleration rate of Pulse Train output 1 to 200,000 (30D40H), load: <br> Command word: 013C <br> LS data word: OD40 <br> MS data word: 0003 |
| On3D | Load Deceleration | Changes a Pulse Train output's deceleration. The Ramp function must be enabled. <br> Example: to change the deceleration rate of Pulse Train output 1 to 2,000 (700H), load: <br> Command word: 013D <br> LS data word: 700 |
| On3E | Load Correction | Sets the change (in microseconds) that should be applied to the duty cycle of a Pulse Train output to compensate for the slow turn-off time of the optical isolator circuit (default to $75 \mu \mathrm{~s}$ ). The range is 0 to 200 microseconds. <br> Example: to change the duty cycle of Pulse Train output 1 to 100 ( 64 H ), load: Command word: 013E <br> LS data word: 64 |

## IC200MDD841

Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/
(4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Using the COMREQ Function to Send Data Commands

The VersaMax PLC CPU can use the COMREQ function to send Data Commands to the High Speed Counter module. These commands are all 6 bytes in length. The command data must be placed in the correct order (in a command block) in CPU memory before the command is executed. Program logic should be set up to assure that the command is sent to the module once, not repeatedly. This function is effective only on counters that are enabled.

## Command Block

The format for Data Commands is as follows:

The command block used to send Data Commands is composed of 10 words as shown below. All values are hexadecimal unless otherwise indicated. Note that if the command block is not set up correctly, unexpected operation may occur. The command block can be placed in any word-oriented area of memory that is not reserved.

| Location | Data |  |
| :--- | :--- | :--- |
| \%R0001 | 0004 | Should be 0004 |
| \%R0002 | 0000 | Reserved (must be zero) |
| \%R0003 | nnnn | Status Data type (0008 = R, 000A=AI, 000C=AQ, 0010=I, 0012=Q) |
| \%R0004 | nnnn | Start location of COMREQ Status word |
| \%R0005 | 0000 | Reserved (must be zero) |
| \%R0006 | 0000 | Reserved (must be zero) |
| \%R0007 | 0003 | HSC application request (always 3) |
| \%R0008 | nnnn | Command word |
| \%R0009 | nnnn | LS data word |
| \%R0010 | nnnn | MS data word |

## (IC200MDD841 <br> Mixed Module, 24VDC Positive Logic Input 20 Points / Output 12 Point/ (4) High Speed Counter, PWM, or Pulse Train Configurable Points

## Command Word Error Responses

If the module receives an invalid command parameter in a Command Word, it returns the following information in the first word of its word input (AI) data:

| Error <br> Code(hex) | Commands | Description |
| :--- | :--- | :--- |
| 0 | All (Unless COMREQ) | No Error |
| $0 \times 11$ | N/A | Unknown command word |
| $0 \times 12$ | Load High/Low Limit | Invalid Low or High limit value |
| $0 \times 13$ | Load Stop Mode/Reset <br> Decelerate Mode | Invalid value. Must be 1 (decelerate) or 2 (stop). |
| $0 \times 14$ | Load Acceleration | Acceleration too low. Must be $\geq 10$. |
| $0 \times 15$ | Load Acceleration | Acceleration too high. Must be $\leq 1,000,000$ |
| $0 \times 16$ | Load Deceleration | Deceleration too low. Must be $\geq 10$. |
| $0 \times 17$ | Load Deceleration | Deceleration too high. Must be $\leq 1,000,000$ |
| $0 \times 21$ | All | Invalid Channel |
| $0 \times 22$ | Load High/Low Limit | New limit places Preload value out of range |
| $0 \times 52$ | Load High/Low Limit | New limit places On Preset out of range |
| $0 \times 62$ | Load High/Low Limit | New limit places Off Preset out of range |
| $0 \times 72$ | Load High/Low Limit | New limit places Accumulator value out of range |
| $0 \times 81$ | Load Accumulator, Load <br> Accumulator Increment | Accumulator value is out of range |
| $0 \times 91$ | Load Preload | Preload value is out of range |
| $0 \times C 1$ | Load On Preset | On Preset value is out of range |
| $0 \times D 1$ | Load Off Preset | Off Preset value is out of range |
| $0 \times E 1$ | Set Counter Direction | Invalid direction value |
| $0 \times F 0$ | Load Timebase | Invalid Timebase |
| $0 \times F 1$ | Load Home Value | Home Value is out of range |

The format for the Module Status Word is:

| MSB |  | LSB |
| :--- | :--- | :--- |
| Source of the command: | Channel (1-4): The module | Error Code, listed |
| 1=AI data, Command Word 1 | channel the Command Word | above |
| 2= AI data, Command Word 2 | data was intended for. |  |
| 3= AI data, Command Word 3 |  |  |
| 4= AI data, Command Word 4 |  |  |
| 5=COMREQ |  |  |

If a COMREQ was used, the error code alone is also returned in the COMREQ Status Word. A COMREQ returns a 1 in the case of no error.

## 13

## Chapter 14

## Temperature-Sensing Modules

This chapter describes the following temperature-sensing VersaMax analog input modules:

- IC200ALG620 Analog Input, 16 Bit RTD, 4 Channels
- IC200ALG630 Analog Input, 16 Bit Thermocouple, 7 Channels

## IC200ALG620 <br> Analog Input, 16 Bit RTD, 4 Channels

The VersaMax Analog Input RTD Module (IC200ALG620) is an intelligent module that accepts input signals from up to 4 RTD input devices and provides input data with 16 bits of resolution.

No external power supply is required for this module. The excitation current for the RTDs is provided by the module, which automatically matches the excitation current to each configured RTD type.

The RTD Analog Input Module accepts inputs from 4 independent 3-wire and/or 4-wire platinum, nickel, nickel/iron, or copper RTDs.

Module features include:

- Selectable resistance measurements in tenths of ohms, tenths of degrees Fahrenheit, or tenths of degrees Celsius
- Individual channel configuration
- Selectable resistance ranges: $0-500$ ohms and $0-3000$ ohms
- Selectable RTD input as resistance or temperature (Celsius or Fahrenheit)
- Reports high/low, underrange/overrange, open wire and input short alarms.
- Two data acquisition rates based on 50 Hz and 60 Hz line frequencies
- Configurable channel activation

## LED Indicators

The green FLD PWR LED indicates the presence of both backplane power and field power for the analog field-side circuits. The absence of either backplane or field power turns off the FLD PWR LED.

The OK LED indicates module status:

- On green indicates normal operation
- Flashing green indicates boot mode or update
- Flashing amber indicates self-diagnostic error
- Off indicates no 3.3 V backplane power

## Diagnostics

The module reports over/under range, open wire, non-volatile memory storage, high/low alarm, and input short diagnostics to the I/O Fault Table.

## Calibration

The module automatically performs A/D calibration at powerup. Automatic calibration is then repeated periodically to compensate for changes in the ambient temperature.

## Host Interface

The RTD Input module provides 4 words of analog input data.

## Compatibility

This module is compatible with:

- VersaMax PLC CPU version IC200CPU001-BC firmware version 1.20 or later.
- Genius NIU version IC200GBI001-AB Firmware version 1.10 or later
- Profibus NIU version IC200PBI001-BB firmware version 1.10 or later
- DeviceNet NIU version IC200DBI001-AA Firmware version 1.10 or later

## IC200ALG620

Analog Input, 16 Bit RTD, 4 Channels

## Wiring Examples

The following illustration shows connections for 3-wire and 4-wire RTDs.
No loop power is required for this module. The excitation current for the RTDs is provided by the module, which automatically matches the excitation current to each configured RTD type.

3-Wire RTD
4-Wire RTD

Required for Calibration if no RTD is Installed

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.

If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## Configurable Parameters

The default parameters of the RTD Input module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above.

| Module <br> Parameter | Description | Default | Choices |
| :--- | :--- | :---: | :---: |
| Analog Input <br> Data Length | Word length of the <br> module's analog input <br> data. | 4 | $0-4$ |
| Analog Input <br> Data Reference | Starting offset for the <br> module's analog input <br> data. |  | user selectable |
| Line Frequency | Specifies the line <br> frequency. | 60 Hz | Active |
| Channel Active | Specifies if the channel <br> should return data and <br> alarms. If a channel is <br> "inactive" space is still <br> allocated for it. | Inactive (off), Active (on) |  |

## IC200ALG620

Analog Input, 16 Bit RTD, 4 Channels

## Module Features

Channel Active
Each channel can be configured as either active or inactive.
If a channel is inactive, it is not scanned and a value of 0 is returned by the module.

## Input Units

Inputs can be measured as tenths of Ohms, tenths of degrees C , or tenths of degrees F . The default is tenths of degrees C . The measurable ranges for each type of input units are shown below.

| Units Selected | Integer Ranges | Engineering Units Ranges |
| :--- | :--- | :--- |
| Tenths of Degrees | -32767 to +32767 | $-3276.7^{\circ}$ to $+3276.7^{\circ}$ |
| Tenths of Ohms | 0 to 65535 | 0 Ohms to 6553.5 Ohms |

## Low Alarm Limit and High Alarm Limit

Each input channel can have a low alarm limit and a high alarm limit. If an input reaches one of its limits, the module reports the actual value and reports an alarm fault in the I/O Fault Table. Alarms do not stop the process or change the value of the input.

Alarm limits can be set anywhere over the dynamic range of the signal. The range for each is $-32,768$ to $+32,767$. The high alarm limit must be greater than the low alarm limit. If alarm reporting is not wanted, alarm limits can be set beyond the dynamic range of the signal so they will never be activated.

## IC200ALG620 <br> Analog Input, 16 Bit RTD, 4 Channels

## Input Selection to Include RTD Type

Each input channel can have a different RTD type. The module supports the RTD types listed below. If the actual RTD resistance does not match a defined type, an adjustment factor can be configured in tenths of ohms.

| Selection | Comments | Selection | Comments |
| :---: | :---: | :---: | :---: |
| 25.5 PT 392 | 25.5 Ohm Platinum, $\alpha=.00392$ at $0^{\circ} \mathrm{C}$ Lab Std | 9.035 CU 427 | $\begin{aligned} & \text { 9.035 Ohm Copper, at } 25^{\circ} \mathrm{C} \text {, } \\ & \alpha=.00427 \end{aligned}$ |

## IC200ALG630

Analog Input, 16 Bit Thermocouple, 7 Channels

The Thermocouple Analog Input Module (IC200ALG630) is an intelligent module that accepts 7 independent thermocouple or millivolt inputs.

The module receives power from the backplane power supply. No external power source is required.
Each input channel can be configured to report millivolts ranges as $1 / 100$ of millivolts, or thermocouple inputs as linearized temperature in tenths of degrees Celsius or Fahrenheit, with or without cold junction compensation.

## LED Indicators

The green FLD PWR LED indicates the presence of both backplane power and field power for the analog field-side circuits. The absence of either backplane or field power turns off the FLD PWR LED.

The OK LED indicates module status:

- On green indicates normal operation
- Flashing green indicates boot mode or update
- Flashing amber indicates self-diagnostic error
- Off indicates no 3.3 V backplane power

## Diagnostics

The module reports over/under range, open thermocouple, non-volatile memory storage, high/low alarm and thermistor error diagnostics to the I/O Fault Table.

## Calibration

The module automatically performs $\mathrm{A} / \mathrm{D}$ calibration at powerup. Automatic calibration is then repeated periodically to compensate for changes in the ambient temperature.

## Module Operation

The Thermocouple Input Module accepts seven inputs from thermocouples and converts them to digital values. The module supports a variety of thermocouple types.

The module converts each analog voltage into a binary ( 15 bits plus a sign bit) value representing tenths $(1 / 10)$ of degrees Celsius or Fahrenheit. The result is read by the module's microprocessor. The microprocessor determines if the input is over or under its configured range, or if an open thermocouple condition exists.

Each input can be configured to report data as millivolt or temperature (tenths of degrees Celsius or Fahrenheit) measurements. When thermocouple inputs are measured, the module can be configured to monitor the thermocouple junction temperature and correct the input value for cold junction. If the module is configured to measure millivolts, the result of the analog-to-digital conversion is a value reported in hundredths $(1 / 100)$ of millivolts ( 625 mV range reports tenths of millivolts).

The module automatically performs A/D calibration at powerup. Automatic calibration is then repeated periodically to compensate for changes in the ambient temperature. New calibration values are filtered into the current calibration values.

## Host Interface

The Thermocouple Input module uses the following data types:

- 7 words of analog input data.
- 7 optional words of analog output data.

The module exchanges data in the same manner as other types of I/O modules: it provides all its input data when requested.

## Compatibility

This module is compatible with:

- VersaMax PLC CPU version IC200CPU001-BC firmware version 1.20 or later.
- Genius NIU version IC200GBI001-AB Firmware version 1.10 or later
- Profibus NIU version IC200PBI001-BB firmware version 1.10 or later
- DeviceNet NIU version IC200DBI001-AA Firmware version 1.10 or later

## IC200ALG630

## Analog Input, 16 Bit Thermocouple, 7 Channels

## Module Specifications

| Module Characteristics |  |
| :---: | :---: |
| Channels | Seven thermocouple or millivolt inputs |
| Module ID |  |
| Isolation: <br> User input to logic (optical) and to frame ground <br> Group to group <br> Channel to channel | 250VAC continuous; 1500VAC for 1 minute <br> Not applicable <br> None |
| LED indicators | OK LED: green indicates backplane power is present. Amber indicates module fault. |
| Backplane current consumption | 5 V output: 125 mA maximum. 3.3 V output: 125 mA maximum. |
| External power supply | None |
| Thermal derating | None |
| Diagnostics | over/under range, open thermocouple, non-volatile memory storage, high/low alarm, thermistor error |
| Input Characteristics |  |
| Thermocouple types | J, K, T, S, R, none (used for mV inputs) |
| Spans (+/-) | $19.5 \mathrm{mV}, 39 \mathrm{mV}, 78.125 \mathrm{mV}$, 156.25 mV , 312.5 mV , 625 mV |
| Converter resolution | 15 bits + sign |
| Cold junction compensation | If used, reference junction temperature is measured at thermocouple termination using a precision thermistor, or supplied by system, or by fixed configuration value. |
| Cold junction temperature error | +/-0.25 degree Celsius (local measurement). To reduce temperature transients, thermocouple terminations should not be installed in the same cabinet as high heat-dissipation assemblies. |
| Conformity error | +/-0.3 degree Celsius, +/-0.5 degree Fahrenheit. |
| Accuracy, at $25^{\circ} \mathrm{C}$ on voltage measurement: on temperature measurement: | $\begin{aligned} & +/-0.2 \% \\ & +/-0.15 \% \end{aligned}$ |
| Temperature sensitivity ( $0^{\circ}$ to $60^{\circ} \mathrm{C}$ ) | $+/-0.004 \%$ of reading, $+/-1.5 \mu \mathrm{~V}$ per ${ }^{\circ} \mathrm{C}$ elsius referred to input |
| Normal mode rejection | 60 dB , at $50 / 60 \mathrm{~Hz}, 100 \%$ span |
| Common mode rejection | 120 dB at $50 / 60 \mathrm{~Hz}, 100$ ohm imbalance |
| Common mode voltage | 3 VDC maximum |
| Maximum voltage between channels | 50 V |
| Normal mode voltage | 5 VDC maximum |
| Update rate | 60 Hz : approximately 60 milliseconds per channel 50 Hz : approximately 70 milliseconds per channel |

## Configurable Parameters

The default parameters of the Thermocouple Input module can be used in many applications. The module can be software-configured when it is installed in a VersaMax PLC system, or an I/O Station controlled by a Network Interface Unit that is version 2.0 or above.

| Module Parameter | Description | Default | Choices |
| :---: | :---: | :---: | :---: |
| Analog Input Data Length | Word length of the module's analog input data. | 7 | 1 to 7 |
| Analog Input Data Reference | Starting offset for the module's analog input data. |  | user selectable |
| Analog Output Data Length | Word length of the module's optional Reference Compensation data. | 0 | 0 to 7 |
| Analog Output Data Reference | Starting offset for the module's optional Reference Compensation data. |  | user selectable |
| Line Frequency | Specifies the line frequency. The module uses this data to control the sampling rate. | 60 Hz | $50 \mathrm{~Hz}, 60 \mathrm{~Hz}$ |
| Suppress Open <br> Thermocouple | Determines whether or not the module will suppress Open Thermocouple diagnostics on the input data. | No | Yes, No |
| Channel Active | Specifies if the channel should return data and alarms. If a channel is "inactive" space is still allocated for it. | Active | Inactive (off) <br> Active (on) |
| Engineering Units | Specifies how the module will report input values | 1/10 degrees C | Millivolts, $1 / 10$ degrees $C$, $1 / 10$ degrees $F$ |
| Thermocouple Type | The type of thermocouple present on each channel. | $J$ | None, J, K, T, S, R |
| Range | For millivolt inputs only, the range for each channel in millivolts. | 625 | $\begin{gathered} 19.53,39.06,78.125,156.25 \\ 312.5,625 . \end{gathered}$ |
| R J Type | Specifies how or whether the channel will perform Cold Junction compensation. | Local | Local, Remote, Fixed, None |
| Alarm Low | The low alarm limit for the channel, in engineering units. | -2000 | $-32,768$ to $+32,767$ |
| Alarm High | The high alarm limit for the channel, in engineering units. | 8000 | $-32,768$ to $+32,767$ |
| Reference Junction Value | Specifies a reference value if Fixed RJ Type has been configured. | 250 | $-32,768$ to $+32,767$ |
| Correction Factor | Specifies optional amount to be added to compensated and linearized input value when a Conversion Type in degrees has been configured. | 0 | $-32,768$ to $+32,767$ |
| Channel Default Input | Specifies analog input returned upon error (including open circuit errors). | 0 | $\pm 32,767$ |
| Cold Junction Default |  | 250 | $\pm 32,767$ |

## IC200ALG630

## Analog Input, 16 Bit Thermocouple, 7 Channels

## Module Features

## Channel Active

Each channel can be configured as either active or inactive. If a channel is inactive, the filtering, scaling, calibration, and alarm checks are omitted for that channel, and a value of 0 is returned for the channel. The reference parameter for the analog input data returns the byte length and is independent of the number of active channels.

## Low Alarm Limit and High Alarm Limit

Each input channel can have a low alarm limit and a high alarm limit. If an input reaches one of its limits, the module reports the actual value and reports an alarm fault in the I/O Fault Table. Alarms do not stop the process or change the value of the input. Alarm limits can be set anywhere over the dynamic range of the signal. The range for each is $-32,768$ to $+32,767$. The high alarm limit must be greater than the low alarm limit. If alarm reporting is not wanted, alarm limits can be set beyond the dynamic range of the signal so they will never be activated.

## Thermocouple Limits

The table below lists millivolt and temperature limits for applicable thermocouple types.

| TC Type | Low mV Limit | High mV Limit | Low Temperature <br> Limit ((C) | High <br> Temperature <br> Limit (C) |
| :---: | :---: | :---: | :---: | :---: |
| J | -8.0960 | 57.9420 | -210.00 | 1000.00 |
| K | -5.8910 | 54.8069 | -200.00 | 1370.00 |
| T | -5.6030 | 20.2520 | -200.00 | 390.00 |
| S | -0.1940 | 18.5040 | -40.00 | 1750.00 |
| R | -0.1880 | 20.8780 | -40.00 | 1750.00 |

## Cold Junction Compensation

The Thermocouple module provides four choices for Cold Junction Compensation.

- No Cold Junction Compensation: This is used for millivolt inputs or if cold junction is maintained at 0 degrees C .
- Remote Cold Junction Compensation: With this option, cold junction is measured externally and provided to the module from the application, via the module's analog output (word output) data. If the module has multiple thermocouples that are configured for remote compensation, the same compensation value must be used by each.
- Fixed Cold Junction Compensation: This option uses a fixed compensation value which is provided as part of the module configuration.
- Local Cold Junction Compensation: The best way to provide local compensation is with an Interposing Thermocouple I/O Terminals. (IC200CHS014), which has a built-in thermistor. Using an Interposing Carrier allows the thermocouple connections to be placed farther away from the I/O modules in the system, which helps shield thermocouple connections from module heat.
If Local Cold Junction Compensation is configured and an Interposing Thermocouple I/O Terminals is not used, a separate thermistor must be installed directly at the module's I/O Carrier, using the Thermistor (+) and Thermistor (-) terminals. The thermistor must be that supplied in kit \# IC690ACC905. Note: If Local Compensation is selected but an Interposing Thermocouple I/O Terminals or local thermistor is not used, erroneous temperatures may be reported and a thermistor error will be reported in the fault table.

## Range Selection

The module is configurable for any of six different millivolt ranges $(+/-): 19.5 \mathrm{mV}, 39 \mathrm{mV}$, $78.125 \mathrm{mV}, 156.25 \mathrm{mV}, 312.5 \mathrm{mV}$, and 625 mV . All but the last provide input readings in hundredths of millivolts. For the 625 mV range, inputs are in tenths of millivolts. When used to read millivolts, the Thermocouple Type configuration parameter must be set to "none".

## IC200ALG630

## Analog Input, 16 Bit Thermocouple, 7 Channels

## Installation Instructions

The preferred installation technique is to mount the Thermocouple Module on a VersaMax Connector-style I/O Carrier (IC200CHS003) and connect thermocouples to an Interposing Thermocouple I/O Terminals (IC200CHS014). The Interposing Thermocouple-style I/O Carrier provides both box-style wiring terminals and a built-in thermistor for Local Cold Junction Compensation. It connects to the Connector-Style Carrier via cable as shown below. This allows the thermocouple connections to be located away from the I/O modules in the system.
However, it is also possible to mount the Thermocouple Module on one of the terminalstyle carriers (box-style, spring-style, compact-style, or barrier-style) and provide Local Cold Junction Compensation by using a kit that includes the correct type of thermistor (IC690ACC905). Both methods are shown below. The thermistor kit must be installed on the A9 and A10 terminals of the carrier.

If the module will only be used to measure millivolt inputs, not thermocouple inputs, it can be mounted on any type of I/O Carrier. The thermistor terminals A9 and A10 cannot be used as millivolt input terminals.

## IC200ALG630 <br> Analog Input, 16 Bit Thermocouple, 7 Channels

## Field Wiring

The terminal assignments for the Thermocouple module shown below are the same for all carriers.

| Terminal | Connection | Terminal | Connection |
| :---: | :---: | :---: | :---: |
| A1 | Channel 1 $(+)$ | B1 | No Connection |
| A2 | Channel 1 (-) | B2 | Shield Termination Point |
| A3 | Channel 2 (+) | B3 | No Connection |
| A4 | Channel 2 (-) | B4 | Shield Termination Point |
| A5 | Channel 3 (+) | B5 | No Connection |
| A6 | Channel 3 (-) | B6 | Shield Termination Point |
| A7 | Channel 4 (+) | B7 | No Connection |
| A8 | Channel 4 (-) | B8 | Shield Termination Point |
| A9 | (Thermistor (+)) | B9 | No Connection |
| A10 | (Thermistor (-)) | B10 | Shield Termination Point |
| A11 | Channel 5 (+) | B11 | No Connection |
| A12 | Channel 5 (-) | B12 | Shield Termination Point |
| A13 | Channel 6 (+) | B13 | No Connection |
| A14 | Channel 6 (-) | B14 | Shield Termination Point |
| A15 | Channel 7 (+) | B15 | No Connection |
| A16 | Channel 7 (-) | B16 | No Connection |
| A17 | No Connection | B17 | No Connection |
| A18 | No Connection | B18 | No Connection |

IC200ALG630
Analog Input, 16 Bit Thermocouple, 7 Channels

## Cable Shield Connections

If possible, the cable should be grounded at the source device. If that is not possible, the cable shield must be grounded at the source device. If that is not possible, the cable shield must be grounded at the I/O module. This can be done using an Auxiliary I/O Terminal (IC200TBM001, 002, or 005).

If the module is installed on a Terminal-style I/O Carrier (IC200CHS001, 002, or 005), shield connections can be made on an Auxiliary I/O Terminal that is attached to the I/O carrier.

If the module is installed on a Compact Terminal-style I/O Carrier (IC200CHS022, 025), shield connections can be made on an Auxiliary I/O Terminal that is mounted near the I/O carrier. Be sure to ground the Auxiliary I/O Terminal Strip if you plan to use it for this purpose.
If the module is installed on a Connector-style I/O Carrier (IC200CHS003), the cable shield can be connected directly to an Interposing Terminal (IC200CHS011, 012, 015). Be sure to ground the Interposing Terminal. It is recommended to use a shielded interposing cable as well between the Interposing Terminal and the Connector Base. A custom shielded cable can be made using the Connector kit (IC200ACC302). In addition, a custom shield braid can be wrapped around standard Interposing Cables (IC200CBL105, $110,120,230$ ). If this approach is used be sure to ground the braid.

## Diagnostics

The Thermocouple module performs diagnostics and provides the following information in the I/O fault table.

Alarm faults are reported if the processed value for a channel exceeds its configured alarm limit.

Over/underrange faults are reported if the millivolt value for an input exceeds the limits of its span.
Open circuit is checked every time a thermocouple input is read (unless Open TC checking is disabled). If the circuit is open, a fault is reported and the input defaults to the configured channel default (this is 0 unless re-configured). If the Thermocouple Type parameter has been configured as "none", open circuit checking is not done.
After an Open Circuit fault condition is corrected, the module takes a few seconds to return to normal operation. During this time, the module continues reporting the channel default input value. After the module has recovered from the Open Circuit fault, it returns to normal inputs and normal operation.

If there is a very large change in an input (for example, an input quickly goes from 50 mV to 400 mV ), the module may briefly report an Overrange fault on that circuit even though the circuit is not actually over its configured upper range limit. This is only temporary.

## Thermistor Fault

A thermistor fault occurs if the calculated temperature value from the thermistor is less than -10 degrees C or greater than +75 degrees C .

```

## Chapter <br> 15

## Accessories

This chapter describes the following VersaMax accessories:

- IC200ACC301 I/O Filler Module
- IC200ACC302 I/O Input Simulator
- IC200ACC303 I/O Shorting Bar

## IC200ACC301 <br> I/O Filler Module

The VersaMax I/O Filler Module (IC200ACC301 can be used as a placeholder for a future I/O module. The I/O Filler has no electrical components. It installs on any VersaMax I/O Carrier in the same way as an I/O module. The carrier is not wired to field devices. The I/O Filler Module protects the carrier electronics against contamination and mechanical damage and also gives the installed equipment a finished appearance.

The CPU or NIU at the head of the equipment sees the carrier where the I/O Filler Module is installed as an "empty" slot. In a VersaMax PLC system that will be configured using the configuration software, the I/O Filler Module and its carrier can be located in any I/O module slot. However, in a system that will be configured using autoconfiguration, the I/O Filler Module and its carrier must be located in the last slot, because autoconfiguration stops at the first empty slot.

## IC200ACC302 Input Simulator

The VersaMax Input Simulator (IC200ACC302) has 16 switches that can be used to easily turn on or off any input on a 24 VDC VersaMax discrete input or mixed I/O module.

The module must be installed on an I/O Carrier with Box Style Terminals (IC200CHS002) or on a Connector-Type I/O Carrier with Box-Type Interposing Terminals (IC200CHS012) or Auxiliary Terminals (IC200TBM002). It can be installed in either the A or B terminals of the carrier.

The Input Simulator can be installed in either the A or B terminals of the carrier, depending on which module inputs should be controlled. After inserting the pins of the Input Simulator, tighten down the screws on the carrier.

A separate external source of 24 VDC power is required. The power supply specifications must be appropriate for the I/O module being controlled. The power supply connection terminals on the Input Simulator accommodate one solid or stranded AWG \#14 (avg. $2.1 \mathrm{~mm}^{2}$ cross section) to AWG \#22 (avg. $0.36 \mathrm{~mm}^{2}$ cross section) wire, or two wires up to AWG \#18 (avg. $0.86 \mathrm{~mm}^{2}$ cross section).

## IC200ACC303 <br> I/O Shorting Bar

Shorting Bars (part number IC200ACC303, quantity 2) can be a cost-effective solution for providing additional bussed terminals for modules that include only one I/O board. The shorting bar has a maximum current-carrying capacity of 2 Amps per point. See the individual module descriptions to determine whether a shorting bar can be used for a particular module.

The figure below shows an example of how a Shorting Bar can be used to provide extra field wiring connections for an I/O module.

A Shorting Bar must be installed directly on the carrier before installing the I/O module.

## Appendix Panel Mounting Dimensions A

This section shows details for mounting the VersaMax modules.

- Module Space Requirements
- Panel Mounting Details

## Thermal Considerations

The thermal performance specified for modules in this manual requires a clearance of 2 inches ( 5.1 cm ) above and below the modules and 1 inch $(2.54 \mathrm{~cm})$ on each side of the modules as shown below, regardless of the orientation of the DIN rail.

## Mounting Modules on a Vertical DIN Rail

When using a vertical DIN rail, the CPU or NIU module must be installed at the bottom.

Some VersaMax I/O modules require thermal derating. The "Thermal Derating" section of these modules' descriptions provides specific derating information. In general, mounting a module on a vertical DIN rail increases the ambient temperature around each module, due to the cumulative effect of the rising heat. Therefore, modules that have a thermal derating when mounted on a horizontal DIN rail will have a greater derating when mounted on a vertical DIN rail

Modules that do not have a thermal derating when mounted on a horizontal DIN rail also have no derating when installed on a vertical DIN rail.

Module Space Requirements

## Module Sizes

The previous diagram shows the length and width of VersaMax Modules. Some modules have physical clearance requirements that should be considered when planning the layout of the system. Module carriers have a projecting connector on the left side that fits into the previous carrier. Clearance for this connector must be included in the overall equipment width allowed for potential future removal/insertion of a carrier. The clearance required per carrier is approximately 6.4 mm (.25in).

## 1 Expansion Transmitter Module

a In NIU I/O Station, allow clearance for cable to pass-through serial port
b Allow adequate space for expansion cable
2 CPU001 or 002, with Power Supply Module
a Allow clearance for opening CPU door to access Run/Stop switch
b Allow adequate space for serial port cables
c Allow adequate space for power wiring
(3) CPU005 / CPUE05 with Power Supply Module
a Allow clearance for opening CPU door to access Run/Stop switch
b Allow adequate space for serial port cables
c Allow adequate space for power wiring

## 4 Compact Terminal Style I/O Carrier

a Allow adequate space for device wiring

## 5 Expansion Receiver Module, Communications Module,

 or Power Supply Booster Carriera (Expansion Receiver Module) Allow space for expansion cables
b (Booster Carrier) Allow adequate space for power wiring

## 6 Connector-Style I/O Carrier

a Allow adequate space for cable. Use of Interposing Carrier is optional.

## 7 Network Interface Unit

a Allow clearance for opening NIU door.
b Allow adequate clearance for cables

## 8 Interposing I/O Terminals

b Allow adequate space for wiring
(9) Auxiliary I/O Terminals
a Multiple Auxiliary Terminals may be used.
b Allow adequate space for device wiring
10 Terminal-Style I/O Carrier
a Allow adequate space for device wiring

## Panel-Mounting Details

In installations where excessive vibration is a factor, the DIN-rail mounted carriers should also be installed on a panel. Mounting dimensions are shown on the following pages.

NOTES:

1. TOLERANCES ON ALL DIMENSIONS ARE $\pm 0.1 \mathrm{~mm}(0.005 I \mathrm{~N})$ NON-CUMULATIVE.
2. $1.1-1.4 \mathrm{Nm}(10-12 \mathrm{IN}$. LBS) OF TORQUE SHOULD BE TO M3.5 (\#6-32) STEEL SCREW THREADED INTO MATERIAL CONTAINING INTERNAL THREADS AND HAVING A MINIMUM THICKNESS OF 2.4 mm (.093 IN).

## Example Mounting Dimensions

In an expansion system, the Expansion Transmitter Module adds 38.1 mm (1.5in) to the left side of the CPU or NIU in rack 0, represented below.

Each expansion rack in an expansion system has an Expansion Receiver Module in slot 0 , with additional modules as shown above.

## Appendix B

Relay Contact Ratings

## Mechanical Rating

Relay contacts are rated for $10^{7}$ operations.

## Electrical Rating

The relay contact use in VersaMax modules meet Underwriters Laboratories' Pilot Duty Rating for Control Circuits. Contact life depends on type of load and current, as summarized in the table below.

| Operating <br> Voltage | Maximum Current for Load Type |  | Typical Contact <br> Life (operations) |
| :---: | :---: | :---: | :---: |

| 32 to 125VDC | 0.2 Amp | not rated | 300,000 |

* Power Factor $=0.4$ minimum for AC inductive loads

Time Constant -7 mS for DC inductive loads
Installing suitable suppression across inductive loads enhances reliability. For DC, a freewheeling diode provides suitable suppression. For AC, an R-C filter can be used.

This appendix summarizes the DC load requirements of all types of VersaMax modules.

It also describes how to calculate the Power Supply requirements of a VersaMax system.

Power Supply Capacities
The Power Supply on the CPU or NIU module provides +5 V and +3.3 V power to the modules in the station. Booster Power Supplies can be used if the modules in the system will draw more current than the CPU or NIU Power Supply can provide. The AC or DC Power Supply on the CPU or NIU and the Power Supply that resides on the Booster Carrier must share the same external power source.

For each Power Supply, the maximum total combined output current from the 5 V and 3.3V outputs is 1.5 Amps. Each power supply provides a maximum of either 0.25 Amp or 1 Amp on its 3.3 V output, as listed in the next table. That portion of the Power Supply's total output current not drawn from the 3.3 V output is available via the 5.5 V output.

| Catalog <br> Number | Description | Maximum Output Current in Amps |  |  |
| :--- | :--- | :---: | :---: | :---: |
|  |  | Total <br> $(5 \mathrm{~V}+3.3 \mathrm{~V})$ | $\mathbf{5 V}$ | $\mathbf{3 . 3 V}$ |
| IC200PWR001 | 24VDC Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V})}\right.$ | 0.25 A |
| IC200PWR002 | 24VDC Expanded 3.3V Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V})}\right)$ | 1.0 A |
| IC200PWR101 | 120/240VAC Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V})}\right.$ | 0.25 A |
| IC200PWR102 | 120/240VAC Expanded 3.3V Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V}}\right)$ | 1.0 A |
| IC200PWR201 | 12VDC Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V}}\right)$ | 0.25 A |
| IC200PWR202 | 12VDC Expanded 3.3V Power Supply | 1.5 A | $\left(1.5 \mathrm{~A}-I_{3.3 \mathrm{~V}}\right)$ | 1.0 A |

## Power Calculation Example

In the example system listed below, the maximum current draw on the Power Supply's 3.3 V output by all of the modules will be 0.215 Amp .

Subtracting 0.215 A from the Power Supply total output of 1.5 A shows that 1.285 A will be available via the 5.5 V output:

$$
(1.5 \mathrm{~A}-0.215 \mathrm{~A}=1.285 \mathrm{~A})
$$

Because the maximum current draw on the 5 V output would be 0.65 A as shown in the table below, any of the available Power Supplies could be used for this system.

| Catalog <br> Number | Description | Backplane Current Consumption in mA |  |
| :---: | :---: | :---: | :---: |
|  |  | 5 V | 3.3 V |
| IC200CPU001 | CPU with 2 serial ports, with EZ Program Store device | 140 | 100 |
| IC200ALG261 | Analog Input Module, 15 Bit Voltage Differential 8 Channels | 200 |  |
| IC200ALG327 | Analog Output Module, 13 Bit Voltage 12 Channels | 50 |  |
| IC200ALG331 | Analog Output Module, 16 Bit Voltage/Current, 1500VAC Isolation, 4 Channels | 10 | 115 |
| IC200MDL650 | Input Module, 24VDC Positive/Negative Logic 32 Points | 50 |  |
| IC200MDL650 | Input Module, 24VDC Positive/Negative Logic 32 Points | 50 |  |
| IC200MDL742 | Output Module, 24VDC Positive Logic 0.5 Amp, w/ESCP 32 Pts | 150 |  |
|  | Total Current Required by Modules | $\begin{aligned} & 650 \mathrm{~mA} \\ & (0.65 \mathrm{~A}) \end{aligned}$ | $\begin{aligned} & \hline 215 \mathrm{~mA} \\ & (0.215 \mathrm{~A}) \end{aligned}$ |

## Module Power Requirements
