## Notes on Ratings and Characteristics

### 1.0 Voltage Grade Table

Voltage Grade	$V_{DRM}$ V	$V_{RRM}$ V	$V_{DSM}$ V	$V_{RSM}$ V	$V_D$ DC V	$V_R$ DC V
12	1200		1300		900	
14	1400		1500		1050	
16	1600		1700		1200	
18	1800		1900		1350	

### 2.0 Extension of Voltage Grades

This report is applicable to other voltage grades when supply has been agreed by Sales/Production.

### 3.0 De-rating Factor

A blocking voltage de-rating factor of 0.13%/°C is applicable to this device for  $T_{vj}$  below 25°C.

### 4.0 Repetitive dv/dt

Standard dv/dt is 1000V/μs.

### 5.0 Snubber Components

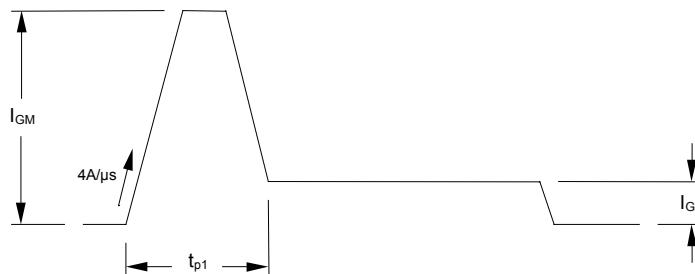

When selecting snubber components, care must be taken not to use excessively large values of snubber capacitor or excessively small values of snubber resistor. Such excessive component values may lead to device damage due to the large resultant values of snubber discharge current. If required, please consult the factory for assistance.

### 6.0 Rate of rise of on-state current

The maximum un-primed rate of rise of on-state current must not exceed 400A/μs at any time during turn-on on a non-repetitive basis. For repetitive performance, the on-state rate of rise of current must not exceed 200A/μs at any time during turn-on. Note that these values of rate of rise of current apply to the total device current including that from any local snubber network.

### 7.0 Gate Drive

The nominal requirement for a typical gate drive is illustrated below. An open circuit voltage of at least 30V is assumed. This gate drive must be applied when using the full di/dt capability of the device.

The magnitude of  $I_{GM}$  should be between five and ten times  $I_{GT}$ , which is shown on page 2. Its duration ( $t_{p1}$ ) should be 20μs or sufficient to allow the anode current to reach ten times  $I_L$ , whichever is greater. Otherwise, an increase in pulse current could be needed to supply the necessary charge to trigger. The 'back-porch' current  $I_G$  should remain flowing for the same duration as the anode current and have a magnitude in the order of 1.5 times  $I_{GT}$ .

## 8.0 Computer Modelling Parameters

### 8.1 Thyristor Dissipation Calculations

$$I_{AV} = \frac{-V_{T0} + \sqrt{V_{T0}^2 + 4 \cdot ff^2 \cdot r_T \cdot W_{AV}}}{2 \cdot ff^2 \cdot r_T}$$

and:

$$W_{AV} = \frac{\Delta T}{R_{th}}$$

$$\Delta T = T_{j\max} - T_K$$

Where  $V_{T0} = 0.85$  V,  $r_T = 0.30$  mΩ.

$R_{th}$  = Supplementary thermal impedance, see table below and

$ff$  = Form factor, see table below.

Sine wave	3.98	2.778	2.22	1.879	1.57		

### 8.2 Calculating thyristor $V_T$ using ABCD Coefficients

The on-state characteristic  $I_T$  vs.  $V_T$ , on page 6 is represented by a set of constants A, B, C, D, forming the coefficients of the representative equation for  $V_T$  in terms of  $I_T$  given below:

$$V_T = A + B \cdot \ln(I_T) + C \cdot I_T + D \cdot \sqrt{I_T}$$

The constants, derived by curve fitting software, are given below for both hot and cold characteristics. The resulting values for  $V_T$  agree with the true device characteristic over a current range, which is limited to that plotted.

25°C Coefficients		125°C Coefficients	
A	1.27624207	A	1.1481301
B	$5.582967 \times 10^{-4}$	B	-0.07739233
C	$2.407706 \times 10^{-4}$	C	$1.873999 \times 10^{-4}$
D	$-4.020685 \times 10^{-3}$	D	0.01475625

### 8.3 D.C. Thermal Impedance Calculation

$$r_t = \sum_{p=1}^{p=n} r_p \cdot \left( 1 - e^{\frac{-t}{\tau_p}} \right)$$

Where  $p = 1$  to  $n$  and:

- $n$  = number of terms in the series
- $t$  = Duration of heating pulse in seconds
- $r_t$  = Thermal resistance at time  $t$
- $r_p$  = Amplitude of  $p_{th}$  term
- $\tau_p$  = Time Constant of  $r_{th}$  term

The coefficients for this device are shown in the table below:

D.C.					
Term	1	2	3	4	5
$r_p$	$1.37 \times 10^{-3}$	$4.86 \times 10^{-3}$	0.0114	0.0223	0.0221
$\tau_p$	$7.6 \times 10^{-4}$	$8.6 \times 10^{-3}$	0.101	0.56	3.12
